소재: 사회적 배제의 위험이 수용 신호에 미치는 영향

원문: 모험담 2014

● In a series of studies, participants were led to believe that they would have either a rich or impoverished social life in the future. ● For example, participants were given feedback from a supposed "personality test" indicating either that they could expect many positive and meaningful social relationships in their lives or that they would likely end up alone in the future. ● In a subsequent task, those participants who were made to feel low in belonging were faster to identify a smiling face in a set of sad and angry faces. ● Participants who were made to feel socially connected did not differ in the speed with which they could find smiling, angry, or sad faces. ● In another experiment, participants' eye movements were tracked. ● Low belonging participants were more likely to look at smiling compared with angry, sad, and neutral faces, and they were slower to disengage their visual attention from smiling faces. ● These results show that the threat of social exclusion can lead people to direct their attention toward sources signaling acceptance.

Virtual Reality (VR) is a simulated experience of the real world (A) which individuals can interact within an artificial three-dimensional environment using electronic devices. Augmented Reality (AR) is a simulated enhancement of the real world using computer-generated perceptual information, typically overlaying digital images onto the real world. Taken together, they are known as "immersive technologies" that may complement or transform traditional journalism. They help provide viewers with a more accurate physical representation of space, spatial relationships, sense of spatial presence, and experienced immersion. The well-known VR film producer Chris Milk, who created a film that puts viewers inside a refugee camp, said the technology is an "ultimate empathy machine" that "connects humans to other humans in a profound way I've never before seen in any other form of media, and it can change people's perception of each other."

It would be outrageous if three similar people, convicted of the same crime, received radically different penalties: probation for one, two years in jail for another, and ten years in jail for another. And yet that outrage can be found in many nations — not only in the distant past but also today. All over the world, judges have long had a great deal of discretion in deciding on appropriate sentences. In many nations, experts have celebrated this discretion and have seen it as both just and humane. They have insisted that criminal sentences should be based on a host of factors: the defendant's age, the crime, the defendant's background, and the defendant's character. Individualized tailoring was the order of the day. (A) As judges are not constrained by rules, criminals won't be treated in a dehumanized way; they would not be seen as unique individuals entitled to draw attention to the details of their situation. The very idea of due process of law seemed, to many, to call for open-ended judicial discretion.

Sometimes we don't have others around to help us, and we get stuck with having to do it all ourselves. Pilots have a technique for doing this that's founded on the old adage of "first things first." This involves giving _____ to some things and postponing others. We do the most important stuff first and let the less important stuff wait. In aviation, we use a simple prioritization scheme: "aviate, navigate, communicate." That means we fly the airplane first. And when that is completely under control, then we navigate. And when we're navigating, then we communicate. But isn't navigating important? Sure, it's the second most important thing. If you lose control of the airplane, no one is going to care whether you crash in eastern Idaho or western Wyoming. The whole point is to fly the airplane and not let either of those things happen. When you're asked to do two things, don't be afraid to admit you can't do two things at once.

A simple definition of *chain of command* is simply the order of authority and power in any organization. What is important to note about chain of command is ❶ that / whose decisions should be made only by those who have responsibility for those decisions. If leaders usurp the authority of the leaders under them and make decisions at those levels, they destroy the ❷ availability / credibility of their subordinates. We see examples of this all the time. A staff member is angry with the decision of their boss and wants to ❸ manifest / manipulate that decision by going to the person over that individual. When this happens, the more ❹ junior / senior leader in this situation needs to send the staff person back to deal with their direct boss to give them the opportunity to fix the situation rather than riding in on their white horse to fix it for the staff. Open-door policies do not mean ❺ that / which you are there to fix things, but rather to give advice on the next steps that need to be followed.

If we ought to treat people as they deserve, and someone deserves to be treated badly, then forgiving him (and giving up the bad treatment) necessarily involves failing to do what we ought to do.

Surely I would know in a minute or so, when my car crested hill.

Have you ever thought about what the world is doing when you are not watching? One day while driving home from work, the freeway was jammed up, so I exited and took a long and windy road home through the countryside. I was thinking about this question and asked myself, "What do I

see right now?" In that moment I could see a rolling hillside covered in green grass under a bluish sunset. (①) But what lay beyond it? (②) But I realized that my story of what lay beyond the hill was a fabrication in my mind. (③) I could imagine the next hill, but the only reason I ascribe any reality to my imagination is that the next hill always appears when I get to the top of this one. In a series of studies, participants were led to believe that they would have either a rich or impoverished social life in the future. For example, participants were given feedback from a supposed "personality test" indicating either that they could expect many positive and meaningful social relationships in their lives or that they would likely end up alone in the future. In a subsequent task, those participants who were made to feel low in belonging were faster to identify a smiling face in a set of sad and angry faces. Participants who were made to feel socially connected did not differ in the speed with which they could find smiling, angry, or sad faces. In another experiment, participants' eye movements were tracked. Low belonging participants were more likely to look at smiling compared with angry, sad, and neutral faces, and they were slower to disengage their visual attention from smiling faces. These results show that the threat of social exclusion can lead people to direct their attention toward sources signaling acceptance.

Competition maintains the system of inequality in both schools and society. Supporting competitive systems is the ideology of competitive individualism — the notion that an individual's success or failure in life depends solely on her or his own efforts and merits, and that each person has an equal chance to compete and succeed. This discounts the powerful influence of race, gender, class, or any other aspects of a person's social identity, on a person's chances for opportunity and success. Competitive individualism places the blame for failure squarely on people rather than on social institutions that privilege some people at the expense of others. The message is clear: both winners and losers deserve what they get. Individualism is very different from individuality, which is the growth of each person's unique and full characteristics. Competitive individualism, in fact, hinders the growth of individuality in many people.

A simple definition of *chain of command* is simply the order of authority and power in any organization. What is important to note about chain of command is that decisions should be made only by those who have responsibility for those decisions. If leaders usurp the authority of the leaders under them and make decisions at those levels, they destroy the credibility of their subordinates. We see examples of this all the time. A staff member is angry with the decision of their boss and wants to manipulate that decision by going to the person over that individual. Have you ever thought about what the world is doing when you are not watching? One day while driving home from work, the freeway was jammed up, so I exited and took a long and windy road home through the countryside. I was thinking about this question and asked myself, "What do I see right now?" In that moment I could see a rolling hillside (A) covering in green grass under a bluish sunset. But what lay beyond it? Surely I would know in a minute or so, when my car crested hill. But I realized that my story of what lay beyond the hill was a _____ in my mind. I could imagine the next hill, but the only reason I ascribe any reality to my imagination is (B) what the next hill always appears when I get to the top of this one. My assumption that the next hillside exists (C) being always verified, but it is verified by a *future observation*. In the *present*, all I know is (D) that I am perceiving right now.

In a series of studies, participants were led to believe that they would have either a rich ① or impoverished social life in the future. For example, participants were given feedback from a supposed “personality test” ② indicating either that they could expect many positive and meaningful social relationships in their lives or that they would likely end up alone in the future. In a subsequent task, those participants who were made ③ to feel low in belonging were faster to identify a smiling face in a set of sad and angry faces. Participants who were made to feel socially connected did not differ in the speed ④ which they could find smiling, angry, or sad faces. In another experiment, participants’ eye movements were tracked. Low belonging participants were more likely to look at smiling ⑤ compared with angry, sad, and neutral faces, and they were slower to disengage their visual attention from smiling faces. Competition maintains the system of inequality in both schools and society. Supporting competitive systems (A) are the ideology of competitive individualism — the notion that an individual’s success or failure in life depends solely on her or his own efforts and merits, and (B) what each person has an equal chance to compete and succeed. This discounts the powerful influence of race, gender, class, or any other aspects of a person’s social identity, on a person’s chances for opportunity and success. Competitive individualism places the blame for failure squarely on people rather than on social institutions that privilege some people at the expense of others. The message is clear: both winners and losers deserve what they get. Individualism is very different from individuality, (C) that is the growth of each person’s unique and full characteristics. Competitive individualism, in fact, hinders the growth of individuality in many people.

Working with solid woods (A) invite us to use the woods that grow around us. It invites us to appreciate our trees and forests at a deeper level. With reverence for the material, we humans may admit to ourselves as true what we are beginning to learn about trees and forests. Peter Wohlleben — German forester, scientist, and author of *The Hidden Life of Trees* — and other scientists, including Suzanne Simard at the University of British Columbia, (B) suggesting that trees have the means to communicate with each other and protect each other from threat. Trees are sophisticated organisms that live in communities, support their sick neighbors, and (C) to have the capacity to make decisions and fight off predators. Wohlleben and Simard have been criticized for anthropomorphizing trees, but they maintain that to succeed in preserving our forests in a rapidly warming world, we must start to look at trees in an entirely new light. Woodworkers can play a role in promoting this understanding of trees. By better understanding how our materials are sourced 우리는 모든 생명체의 상호 연결성에 대한 감각을 엮어 만드는 데 도움을 줄 수 있다. By doing so, we can find greater meaning and purpose in our work and greater respect from others as we do it.

The sights, sounds, smells, tastes and feel of the world around us are solid, crisp, distinct and real. We do not doubt them; 'Seeing is believing.' The act of sensing something for ourselves cements it in reality — no longer a story told or heard, (A) experiencing second-hand, but a fixed representation of the real world around us, as solid as the floor beneath our feet, and as sharp as the knife blade that cuts our finger, as bright as the sun blinding us with its light. Our sensations are our portal into the physical world that envelops us, moulds and (B) shaping us. Through the act of sensation, doubt is cast aside, our faith in what we see or hear more absolute than a devout person's belief in God. In Aristotle's view, the five senses are the basis of all knowledge, (C) which we observe the 'essence' of the world; through our senses, the material world interacts with our psyche. Via clever experimental tricks, a young researcher has shown that high pitches associated with footfalls cause people to feel lighter, whereas low pitches cause people ③ to feel heavier. A simple definition of *chain of command* is simply the order of authority and power in any organization. What is important to note about chain of command is that 결정은 그 결정에 책임이 있는 사람에게 의해서만 내려져야 한다. If leaders usurp the authority of the leaders under them and make decisions at those levels, they destroy the credibility of their subordinates. We see examples of (A) this all the time. A staff member is angry with the decision of their boss and wants to manipulate that decision by going to the person over that individual. When (B) this happens, the more senior leader in this situation needs to send the staff person back to deal with their direct boss to give them the opportunity to fix the situation rather than riding in on their white horse to fix it for the staff. Open door policies do not mean that you are there to fix things, but rather to give advice on the next steps that need to be followed.

Know-how and information are ① distinct, but they are also intimately connected. The ability of a system to pack know-how depends largely on the fluidity with which it can use information to ② reconstruct the dynamic networks it needs to accumulate that know-how. A seed is a perfect example of (A) this. It is a package containing both the know-how and the information needed to create a plant, such as a tree. The development of a tree is nothing other than the majestic unpacking of know-how ③ facilitated by genetic information. A seed unpacking into a tree unpacks the know-how needed to perform photosynthesis, to build the structures that will transport nutrients and water from the ground to the leaves, and to ④ defend itself against pests. An emerging organizing theme in neuroscience is that the brain has evolved, fundamentally, to make _____ (A). The claim here is not that the business of anticipating events is one of the brain's important chores: it is *the* main reason for having

(big) brains in the first place. It's a perspective that seems counterintuitive at first, but you will warm up to it as soon as you see how the brain handles otherwise puzzling facts. The core idea is as follows. We can interact with the world in an infinite number of ways. Such complexity would quickly overwhelm us. So for behavior to be purposeful and timely in such a high-dimensional environment, the set of possible choices must be pruned. We accomplish this by continuously, automatically and, importantly, unconsciously generating expectations that meaningfully inform — constrain — perception and action at every moment in life. Fingerprints develop early in the pregnancy period. Between the sixth and thirteenth weeks of life, the characteristic bumps are already forming on the foetal fingers and palms. Innumerable environmental factors will now influence the formation of the unique pattern, including the exact position of the foetus in the womb at an exact moment, and the exact composition and

density of surrounding amniotic fluid that circulates around the fingers as they touch whatever they meet. The movement of the baby as he or she shifts around inside the womb and the speed and size to which he or she grows — all affect how the fingerprint patterns form and ensure that the truly unique physical feature, which will distinguish each of us from anyone else, is never copied. In the entire course of human history, there is virtually no chance of the same exact fingerprint pattern forming twice, because there is no chance of an _____ set of pre-natal events occurring to the same extent in the same way at the same time. In 2019, researchers at the University of the West of England conducted a survey of 5,000 passengers commuting to London from the Midlands. Fifty-three percent of them used Wi-Fi to “catch up” on work, thus, essentially, working. Email is the thin end of a wedge of work activities. Email allows someone (A) (start) engaging with their tasks, boss, and colleagues before they even physically set foot in the office, (B) (prepare) themselves psychologically for the role they need to play. In his 2019 paper “Between Home and Work: Commuting as an Opportunity for Role Transitions,” Jon Jachimowicz, from Harvard Business School, found that commuting offered an opportunity to conduct “work-related prospection” and “boundary management strategies,” a process of planning ahead that helps busy parents and executives get the most out of their day and feel more satisfied. When someone applies makeup on a busy early morning train into work, or in their car, they are literally putting their “game face” on. Checking email complements this psychological preparation for work, and (C) (give) someone a liminal zone before they are actually obligated to respond.

① 미국 인류학의 창시자인 Franz Boas는 인간의 생물학적 차이에 대한 분류학적 접근에 이의를 제기한 최초의 과학자 중 한 명이었다. ② 구체적으로 말하면, 그는 머리 모양과 여타의 이른바 인종적 표지들이 시간이 지나도 본질적으로 변하지 않는 정적인 실체라는 널리 받아들여진 개념을[개념의 진위를] 시험해 보고자 했다. ③ 1900년대 초에, 그와 그의 연구자들은 약 18,000가구의 이민자 가정을 연구하여 유럽에서 태어난 부모와 미국에서 태어난 그들의 자녀들의 머리 길이에 대한 머리 너비의 비율인 두장폭지수를 계산하였다. ④ 이 연구 결과는 어른과 자녀의 머리 모양이 많이 다르지는 않지만, 수학적으로 표현될 수 있는 정도로 차이가 난다는 것을 밝혀냈다. ⑤ 이 연구 결과는 그 당시 널리 퍼져 있던 인종 유형은 선천적으로 변하지 않는다는 생각을 약화시켰다. ⑥ 예로서 언급되었던 다양한 인종들 사이의 차이점이 불변하는 것이 아니었기 때문에, Boas는 인종 개념이 근거가 없다고 결론지었다. ⑦ Boas의 연구는 유형학적 분류보다는 생물학적 과정에 과학적 초점을 맞추는 것을 위한 토대를 마련하였다.

① Simplifying an explanation, description or argument is not always a bad thing to do. ② In fact, it can be very useful. ③ To truly understand a physical phenomenon, to reveal its essence, the scientist will attempt to strip away the unnecessary detail and expose its bare bones (always 'as simple as possible, but no simpler'). ④ For example, laboratory experiments are often carried out under specially controlled conditions to create artificial and idealized environments that make the important features of a phenomenon easier to study. ⑤ Unfortunately, this hardly ever applies when it comes to human behavior. ⑥ The real world is messy and often far too complicated to simplify. ⑦ There is a well-known joke — to physicists, at any rate — about a dairy farmer who wishes to find a way of increasing the milk production of his cows and so seeks the help of a team of theoretical physicists. ⑧ After carefully studying the problem, the physicists finally tell him they have found a solution, but that it only works if they assume a spherical cow in a vacuum.

The purity of recycled products plays a key role in explaining the strength of demand for them. One of the reasons for the high rate of aluminum recycling and the much lower rate of plastics recycling is the ① differential difficulty with which a high-quality product can be produced from discarded materials. Whereas bundles of aluminum cans have a relatively ② uniform quality, waste plastics tend to be highly contaminated with nonplastic substances or with plastics of very different types, and the plastics manufacturing process has little tolerance for impurities. Remaining contaminants in metals can frequently be eliminated by high-temperature combustion, but plastics are ③ destroyed at such high temperatures. Swift geographical expansion was one of the factors that undermined democracy in the Middle East. Early democracy in pre-Islamic Arabia, as in many other human societies, was a small-scale, face-to-face affair; elders from individual tribal groups would assemble, discuss, and reach some sort of a conclusion. The process was an informal one, precisely because the circumstances allowed for informality. With the Islamic conquests, the question was posed of how to govern not in a face-to-face setting but instead across distances of hundreds and even thousands of miles. Some scholars have suggested that in this situation what was needed was the practice eventually adopted by Europeans: a form of political representation that could allow for democratic governance over large distances. But Europeans took centuries of trial and error to arrive at this solution; the inhabitants of the Islamic world would have needed to figure this out within a matter of decades.

But one cannot fully understand a cognitive process like color-vision or symbol-interpretation or anger without experiencing that sort of thing. It is one thing to explain how operations originate and another to know what it is like to perform them. The physiology of inebriation can be learned by everyone. It is important to realize that policymakers do not have very much information at the time when they must make policy decisions. For instance, the consumer price index is available only with a one-

month lag, so our knowledge of inflation is always running a month behind the actual economy. The GDP (Gross Domestic Product) is even worse. The GDP data are available only quarterly, and we do not find out about GDP until well after a quarter ends, and even then substantial revisions to the numbers often occur many months after the quarter. The point is simply that the Federal Reserve, the Monetary Policy Committee, and other policymaking institutions must formulate policy today on the basis of less than complete knowledge of the *current* situation, and the policy must be addressed to a best guess of the *future* situation. The fact that emotions are unlearned, automated, and set by the genome always raises the specter of genetic determinism. Is there nothing personal and educable about one's emotions? The answer is that there is plenty. The essential mechanism of the emotions in a normal brain is indeed quite similar across individuals, and a good thing too because it provides humanity, in diverse cultures, with a common ground of fundamental preferences on the matters of pain and pleasure. But while the mechanisms are distinctly similar, the circumstances in which certain stimuli have become emotionally competent for you are unlikely to be the same as for me. There are things that you fear that I do not, and vice versa; things you love and I do not, and vice versa; and many, many things that we both fear and love. In other words, emotional responses are considerably customized relative to the causative stimulus. In this regard, we are quite alike but not entirely.

Émile Durkheim에 관한 다음 글의 내용과 일치하지 않는 것은?

The French sociologist Émile Durkheim advocated functionalism. Durkheim was the first to promote science as a basis for making sociological decisions. Rooted in the French political and social upheaval from 1870 to 1895, Durkheim believed changes in

social institutions and quality of life occurred through political reform and scientific advances. He was the first to suggest that to understand an individual one must not look at the individual, but rather at the society or group in which that individual is a member. Durkheim believed society was greater than its individuals and that society's components had tremendous power to shape and influence human behavior. He believed individualism and self-interest threatened the cohesion of social institutions and undermined the authoritative nature of group life. As a result, individual autonomy came at the expense of the good of the collective forces. Consequently, Durkheim was an advocate of moral education, due to his concern with increasing individualism. He advocated that society's different components comprise a collective conscience that affects individual thought and behavior for the good of the whole.

Managed forests are second-growth forests that have been planted, thinned, fertilized, and sprayed with pesticides, just like a farmer’s field. One of the first things you notice when you walk in a managed forest is that the trees are smaller than in an old-growth forest. And the forest looks mostly brown, instead of green. This is because the trees are all the same age, the same size and the same height. The trees grow close together, and very little light gets through their branches. This means that there aren’t any berry bushes or other plants on the forest floor because they can’t get enough light to grow. Because the trees are so young, they don’t have any mosses growing on them. Without the nurse logs and snags and diversity of plants, there is less habitat available for wildlife. We can still hear birds chirping high up in the canopy, but overall there is much less biodiversity in a planted second-growth forest.

The fact that emotions are unlearned, automated, and set by the genome always raises the specter of genetic determinism. Is there nothing personal and educable about one’s emotions? The answer is that there is plenty. ① The essential mechanism of the emotions in a normal brain is indeed quite similar across individuals, and a good thing too because it provides humanity, in diverse cultures, with a common ground of fundamental preferences on the matters of pain and pleasure. ② But while

the mechanisms are distinctly similar, the circumstances in which certain stimuli have become emotionally competent for you are unlikely to be the same as for me. ③ Varied emotions are the result of the processing of sensorial stimuli through cognitive mechanisms. ④ There are things that you fear that I do not, and vice versa; things you love and I do not, and vice versa; and many, many things that we both fear and love. ⑤ In other words, emotional responses are considerably customized relative to the causative stimulus, and we are quite alike but not entirely in this regard.

Simplifying an explanation, description or argument is not always a bad thing to do. In fact, it can be very useful. To truly understand a physical phenomenon, to reveal its essence, the scientist will attempt to strip away the unnecessary detail and expose its bare bones (always 'as simple as possible, but no simpler'). For example, laboratory experiments are often carried out under specially controlled conditions to create artificial and idealized environments that make the important features of a phenomenon easier to study. Unfortunately, this hardly ever applies when it comes to human behavior. The real world is messy and often far too complicated to simplify. There is a well-known joke — to physicists, at any rate — about a dairy farmer who wishes to find a way of increasing the milk production of his cows and so seeks the help of a team of theoretical physicists. After carefully studying the problem, the physicists finally tell him they have found a solution, but that it only works if they assume a spherical cow in a vacuum.

The ① purity of recycled products plays a key role in explaining the strength of demand for them. One of the reasons for the high rate of aluminum recycling and the much lower rate of plastics recycling is the differential difficulty with which a high-quality product can be produced from ② discarded materials. Whereas bundles of aluminum cans have a relatively uniform quality, waste plastics tend to be highly contaminated with nonplastic substances or with plastics of very different types, and the plastics manufacturing process has ③ much tolerance for impurities. Remaining contaminants in metals can frequently be eliminated by high-temperature combustion, but plastics are destroyed at such high temperatures. Finally, waste that contains hazardous materials, such as mercury and lead, ④ raises additional complexities. Swift geographical expansion was one of the factors that undermined democracy in the Middle East. Early democracy in pre-Islamic Arabia, as in many other human societies, was a small-scale, face-to-face affair; elders from individual tribal groups would assemble, discuss, and reach some sort of a conclusion. The process was an informal one, precisely because the circumstances allowed for informality. With the Islamic conquests, the question was posed of how to govern not in a face-to-face setting but instead across distances of hundreds and even thousands of miles. Some scholars have suggested that in this situation what was needed was the practice eventually adopted by Europeans: a form of political representation that could allow for democratic governance over large distances. But Europeans took centuries of trial and error to arrive at this solution; the inhabitants of the Islamic world would have needed to figure (A) this out within a matter of decades.

It is one thing to explain how operations originate and ③ the other to know what it is like to perform them. The physiology of inebriation can be learned by everyone. But only the person who drinks can comprehend it in the “inner” experiential mode of cognitive access. The mental performances that reflect meaning and purpose can ④ understand only from within the orbit of experience (though their occurrence can doubtless be detected and accounted for through external scientific-causal examination). Franz Boas, the founder of American anthropology, was among the first scientists to challenge the taxonomic approach to human biological variation. Specifically, he wanted to test the widely held notion that head shape and other so-called racial markers were static entities, essentially unchanging through time. In the early 1900s, he and his researchers studied some 18,000 immigrant families, calculating the cephalic index — the ratio of head length to head breadth — of parents born in Europe and of their children born in the United States. The results of this study revealed that the adults' and children's head shapes differed, not by a lot but by a degree that could be expressed mathematically. This finding undermined the idea, prevalent at the time, that racial types were innately _____. It would be outrageous if three similar people, convicted of the same crime, received radically different penalties: probation for one, two years in jail for another, and ten years in jail for another.

- (A) If judges were constrained by rules, criminals would be treated in a dehumanized way; they would not be seen as unique individuals entitled to draw attention to the details of their situation. The very idea of due process of law seemed, to many, to call for open-ended judicial discretion.

Sometimes we don't have others around to help us, and we get stuck with having to do it all ourselves. Pilots have a technique for doing this that's founded on the old adage of "first things first." This involves giving priority to some things and postponing others. We do the most important stuff first and let the less important stuff wait. In

aviation, we use a simple prioritization scheme: "aviate, navigate, communicate." That means we fly the airplane first. And when that is completely under control, then and only then do we move on to the other two things in the list. But isn't navigating important? Sure, it's the second most important thing. If you lose control of the airplane, no one is going to care whether you crash in eastern Idaho or western Wyoming. The whole point is to fly the airplane and not let either of those things happen. The sober self-disciplined character of the nineteenth century yielded long ago to that of the consumer, endlessly flattered as being in the driving seat, 'free to choose' and urged to enjoy. Gerda Reith argues that this presents a paradox, citing the passage from *Civilization and Its Discontents* where Sigmund Freud asserts that civilization requires the renunciation of instinct, as the cause of discontent. The source of current discontent for consumers is that, on the one hand, they are told to enjoy, to assemble a unique identity from the meanings presented by offerings in the marketplace; on the other, they are warned that they must suppress their desire, constraining their enjoyment within socially approved bounds. This is heightened today in the age of

‘sustainability’ and ‘prosperity without growth’. The consumer walks a tightrope in seeking to ensure they are not wrong footed by desire. The fate for those who cannot maintain their balance is to be labelled a ‘disordered’ consumer, addicted to any or all of a proliferating number of activities and substances deemed dangerous from alcohol, gambling, caffeine, the Internet, to shopping and credit.

밑줄 친 a mental headline이 다음 글에서 의미하는 바로 가장 적절한 것은?

Consciousness is the smallest player in the operations of the brain. For better understanding, consider a newspaper. When you pick up a newspaper, you won't be surprised that none of the details of the activity in a nation are listed in the paper; after all, you want to know the bottom line. You want to know that Congress just signed a new tax law that affects your family, but the detailed origin of the idea isn't especially important to that new bottom line. You don't care how the garbage is produced and packed away; you only care if it's going to end up in your backyard. That's what you get from reading the newspaper. Your conscious mind is that newspaper. Your brain buzzes with activity around the clock, and, just like the nation, almost everything occurs locally: small groups are constantly making decisions and sending out messages to other groups. Out of these local interactions emerge larger coalitions. By the time you read a mental headline, the important action has already occurred, the deals are done. You have little access to what happened behind the scenes. Entire political movements gain ground-up support and become unstoppable before you ever catch wind of them as a feeling or a thought that strikes you. You're the last one to hear the information.

A large number of mammalian species, including humans, occasionally work at deceiving others outside their troop or living unit. To the outsiders, individuals attempt to appear stronger or weaker, healthier or sicker than they really are. ① Within human groups, people deceive not only outgroup members but ingroup members as well — spouses, children, village leaders. ② In truth, it is beyond my expertise to know if people in all human cultures behave counter to the established rules in their society and, if they do, they occasionally keep their actions secret. ③ Similarly, I cannot attest to whether all human cultures have words such as “lie,” “deceive,” “trick,” “shame,” or “guilt” in their vocabularies. ④ However, the existence of a wide range of expressions for a specific object or concept is such a universal phenomenon that it occurs in all languages. ⑤ Whatever the final judgement as to the universality of deception, our data would suggest that, to the extent that individuals must actively conceal important information from others in their social network, the act of concealment should be stressful.

Beliefs and personalities change continually as people grow. My belief about the existence of Santa Claus is now completely opposed to the belief I had when I was young. Was I brainwashed by the adult world? No. I simply grew up, gradually accepting along the way that there was no such person as Santa Claus. But consider my friend Keith's extremely strong belief in Christianity. If Keith were to vanish for a month and then

reappear an enthusiastic atheist I would suspect that someone had been exerting undue influence, whereas if I hadn't seen Keith for ten years I would be much more likely to attribute the lapse to natural causes. Several nineteenth-century scholars noted that the basis of social solidarity changed as societies became larger and more diverse. ① Instead of the cultural similarity that constitutes mechanical solidarity, societies with a complex division of labor are held together by their *differences*: the cobbler depends on the baker for bread, who depends on the carpenter for shelter, who depends on the blacksmith for tools, who depends on the cobbler for shoes. ② With this kind of economic interdependence, it did not matter so much that people thought and believed the same things and looked at the world in a distinctive way. ③ Such excessive interdependence between industries have made companies weak enough to collapse like dominoes in an economic crisis. ④ Therefore, common culture became less important, and

When reasoning by analogy, a person starts with a new, unfamiliar target problem to solve. She then considers other source settings she knows well and compares them to the target through a process of similarity mapping. By finding a source problem she believes has similar characteristics as the target, she identifies a candidate solution that solved or could have solved the source problem. The whole process may be summed up like this: "I've seen something like this before, so what worked there may work here." While analogical reasoning can be a valuable source of insight and creativity, it can lead to poor solutions when problem solvers develop analogies based on superficial similarities instead of deep causal traits. When problem solvers have deep experience in a particular domain, their knowledge is salient and easy to recall, which can lead them to pay more attention to characteristics of the new setting that seem similar and ignore those that are different, and to develop superficial analogies and poor solutions. Experience can be a poor guide when working outside your area of expertise or when the nature of your work changes.

In a study, infants are first habituated to some recurring event — for example, a toy car that rolls down an inclined ramp, passes behind one end of a screen, and exits at the other end. Initially, this event is quite interesting and infants attend to it closely; eventually, however, looking times drop off, reflecting the fact that the babies are habituating to the familiar event. Following habituation, the infants see a box placed behind a screen. In one experimental condition (the *possible event*) the box is placed behind the tracks on which the car runs; in the other experimental condition (the *impossible event*) the box is placed directly on the tracks. The screen is then set back in place, and the car again makes its journey from one side to the other. Infants show little dishabituation to the possible event; looking times shoot up, however, when the car appears to pass magically through another solid object. Note that the babies cannot see the car and box at the point of their apparent contact; rather, they can be surprised by the impossible event only if they realize that both the car and box continue to exist while out of sight.

Consciousness is the smallest player in the operations of the brain. For better understanding, consider a newspaper. When you pick up a newspaper, you won't be surprised that none of the details of the activity in a nation are listed in the paper; after all, you want to know the bottom line. You want to know that Congress just signed a new tax law that affects your family, but the detailed origin of the idea isn't especially important to that new bottom line. You don't care how the garbage is produced and packed away; you only care if it's going to end up in your backyard. That's what you get from reading the newspaper. Your conscious mind is that newspaper. Your brain buzzes with activity around the clock, and, just like the nation, almost everything occurs locally: small groups are constantly making decisions and sending out messages to other groups. Out of these local interactions emerge larger coalitions. By the time you read a mental headline, the important action has already occurred, the deals are done. You have _____. A large number of mammalian species, including humans, occasionally work at deceiving others outside their troop or living unit. To the outsiders, individuals attempt to appear stronger or weaker, healthier or sicker than they really are. Within human groups, people deceive not only outgroup members but ingroup members as well — spouses, children, village leaders. In truth, it is beyond my expertise to know if people in all human cultures behave counter to the established rules in their society and, if they do, they occasionally keep their actions secret. Similarly, I cannot attest to whether all human cultures have words such as “lie,” “deceive,” “trick,” “shame,” or “guilt” in their vocabularies. Whatever the final judgement as to the universality of deception, our data would suggest that, to the extent that individuals must actively conceal important information from others in their social network, the act of concealment should be stressful.

Beliefs and personalities change continually as people grow. My belief about the existence of Santa Claus is now completely opposed to the belief I had when I was young. Was I brainwashed by the adult world? No. I simply grew up, gradually accepting along the way that there was no such person as Santa Claus. But consider my friend Keith's extremely strong belief in Christianity. If Keith were to vanish for a month and then reappear an enthusiastic atheist I would suspect that someone had been exerting undue influence, whereas if I hadn't seen Keith for ten years I would be much more likely to attribute the lapse to natural causes. In other words, the shorter the time of transition — between old and new beliefs — the more likely that some form of brainwashing has occurred.

Several nineteenth-century scholars noted that the basis of social solidarity changed as societies became larger and more diverse. Instead of the cultural similarity that constitutes mechanical solidarity, societies with a complex division of labor are held together by their *differences*: the cobbler depends on the baker for bread, who depends on the carpenter for shelter, who depends

on the blacksmith for tools, who depends on the cobbler for shoes. With this kind of economic interdependence, it did not matter so much that people thought and believed the same things and looked at the world in a distinctive way. It would be outrageous if three similar people, convicted of the same crime, received radically different penalties: probation for one, two years in jail for another, and ten years in jail for another. And yet that outrage can be found in many nations — not only in the distant past but also today. All over the world, judges have long had a great deal of discretion in deciding on appropriate sentences. In many nations, experts have celebrated this discretion and have seen it as both just and humane. They have insisted that criminal sentences should be based on a host of factors 범죄뿐만 아니라 피고의 성격과 사정도 포함하는. Individualized tailoring was the order of the day. (A) As judges are not constrained by rules, criminals won't be treated in a dehumanized way; they would not be seen as unique individuals entitled to draw attention to the details of their situation. The very idea of due process of law seemed, to many, to call for open-ended judicial discretion.

Sometimes we don't have others around to help us, and we get stuck with having to do it all ourselves. Pilots have a technique for doing this that's founded on the old adage of "first things first." This involves giving _____ to some things and postponing others. We do the most important stuff first and let the less important stuff wait. In aviation, we use a simple prioritization scheme: "aviate, navigate, communicate." That means we fly the airplane first. And when that is completely under control, then and 그때서야 비로소 우리는 목록의 다른 두 가지 항목으로 넘어간다. But isn't navigating important? Sure, it's the second most important thing. The sober self-disciplined character of the nineteenth century yielded long ago to that of the consumer, endlessly (A) flattering as being in the driving seat, 'free to choose' and urged to enjoy. Gerda Reith argues that this presents a _____, citing the passage from *Civilization and Its Discontents* where Sigmund Freud asserts that civilization requires the renunciation of instinct, as the cause of discontent. This is heightened today in the age of 'sustainability' and 'prosperity without growth'. The consumer walks a tightrope in seeking to ensure they are not wrong footed by desire. Because actions are carried out in all walks of life, they have useful things to say about virtually all that you do. Start with sports. Each year, millions of dollars are spent on methods for helping runners run faster, broad jumpers jump farther, pole vaulters vault higher, and so on. Sports have seen huge advances in the past century, with new records being set at an astonishing pace. Records have been set because new approaches have been taken to sports training as well as sports equipment, sports clothing, and the venues where sporting events take place. If you look at clothing worn by athletes in past times, it's no wonder that players today can perform so much more easily and effectively. Add to the new ways of dressing, changes in eating and the emergence of sports psychology (an entire discipline devoted to helping people prepare mentally as well as physically for competitions), and you can see how greater enlightenment has led to better athletic performance.

Neuroscientists such as David Eagleman have done studies to examine the brain's internal clock. In one experiment, subjects watched a movie with fast-running cheetahs, with their legs coming off the ground, like Trinity in *The Matrix*. During the movie, a red dot of a fixed duration is flashed, when all four legs are suspended in midair. The same experiment is repeated with a small twist; in the second experiment, the same cheetah movie was played in slow motion, and the same annoying red dot blinked for the same duration as it had before when the cheetah caught air at normal speed. After the tests were compared, moviegoers believed that the red dot during the slow motion movie was shorter. "Your brain says I need to readjust my sense of time," said Eagleman. Our brain determines the time based on our knowledge of the laws of physics. Our perception of time is shaped by the events it uses to measure time.

In one study, subjects felt the duration of the same red dot was shorter when it appeared in a _____ (A) _____ version of the film than in the original one, which means that the time we perceive is _____ (B) _____, as it is affected by the events used to measure time.

From cave paintings to smartphones, human beings have been drawing or typing lines, letters, and figures, seeing their ideas, imaginings, thoughts, and dreams materialize outside their minds. They have done so not only to transmit them to others but also to converse with those others who are in fact themselves, reflecting upon their reflections. We use pieces of paper and computer screens to remember things we fear shall be forgotten, to perform complicated calculations we cannot complete in our heads alone, to organize the chaos that fills them, to ponder, and even simply to wander in our imaginations while doodling funny heads or endless chains of flowers. We conduct our lives surrounded by external devices that help us recall information, calculate, plan, design, make decisions, articulate ideas, and reflect once and again upon our inner thoughts and images. It shouldn't be surprising to consider that there might be a set of complex rules that governs how linguistic units are stuck together or organized.

- (A) In introductory chemistry classes, a student learns the different elements of matter and what they're composed of, as well as learning the rules that govern how those elements/atoms are allowed to stick together. With that knowledge, they can begin to construct and deconstruct more complex organizations of matter.
- (B) After all, in what other science do we not see the same principle at play? Consider chemistry. The basic building blocks are atoms which together form molecules. But you can't just take any old atoms and stick them together.
- (C) Each molecule is made up of a very specific combination of a very specific set of atoms. Consider water: We know that a water molecule is made up of two atoms of hydrogen and one of oxygen. Those amounts of those specific atoms follow some general principles of atom combination rules, and consequently, that type of molecule can exist.

The forms of social order that our species has invented in the past seven thousand or so years — involving cities and markets and modern telecommunications — are surely a force in our natural selection. ① People's experiences of interacting with strangers thanks to those inventions are likely changing our genes. ② For instance, as a species, we may be getting smarter because we live in cities, where urban culture is getting ever more complex, stimulating, and demanding. ③ We almost certainly are evolving to have different immune systems (and related physiological traits) as members of our species live in denser and denser aggregations, and as people move over ever longer distances between cities, which gives rise to new sorts of epidemics. ④ As contact with new climate and creatures increased, diseases that existed independently in each region spread around the world, and new epidemics emerged. ⑤ For instance, mutations appear to have recently arisen in our species that confer resistance to epidemics of typhoid newly made possible by urbanization and long distance trade in Europe in the past few thousand years.

In European history, many of the song forms favored by the most popular performers were explicitly connected to dances. These origins are often preserved in the musical terminology we use today. The *rondo* is now treated as a specifically musical form with a recurring refrain, but the term likely derives from the circular dance that accompanied the *rondeau* of the wandering musicians of the late medieval era. Today we use the word *carol* to describe a Christmas song, but it comes from a very popular dance of that period, the *carole*. A host of other terms, from minuet to waltz, are now used to describe concert hall music, but originated among dancers. I doubt we will ever grasp the full impact of dancing on musical style, which shows up even where we least expect to find it. Charles Rosen, in his seminal study *The Classical Style*, marvels over the process by which the four-bar phrase gained a “stranglehold on rhythmic structure” in classical music, and is forced to conclude that “the periodic phrase is related to the dance, with its need for a phrase pattern that corresponds to steps and to groupings.” In other words, even the elitist masterworks of Mozart and Beethoven move to the beat of the peasants' feet.

Low-level anxiety is present in our lives so often, like the air we breathe, that we might not even notice it.

Everyday anxiety is nothing surprising; we all experience worries, concerns, even moments of panic sometimes. But anxiety isn't a binary proposition, like a light switch that's either on or off. (①) Imagine instead a dimmer sliding up and down, sometimes quickly, other times hardly at all. (②) It happens when we open the door to meet our new boss or when we look outside and see snow coming down as we're packing up for our drive home; suddenly we're paying close attention to something we'd really rather not think about, but the feeling doesn't last for more than a minute or two. (③) Once I meet my new boss, I soon get a sense of what she's like and my anxiety subsides. (④) As I start driving home, I see that the roads are still clear, so my worries ease. A well-known and puzzling paradox of psychophysical magnitude perception is that people are rather good at *discriminating* the intensity of different magnitudes, but remarkably poor at categorizing them absolutely. The prospect of a win-win solution for farmers and the planet rapidly attracted the attention of both media and industry onlookers, who began enthusiastically promoting such practices as “regenerative” agriculture. The French government challenged nations around the world to commit to increasing soil carbon by four-tenths of a percent per year, based on a scientific analysis showing that such an effort could offset 20 to 35 percent of greenhouse gas emissions caused by human activity. In conservative states like South Dakota and Mississippi, no-till farmers and holistic management ranchers — who rotate their animals in ways that mimic native animals that only eat plants — began proudly calling themselves “carbon cowboys,” promoting large-scale investments from major companies. The

Rodale Institute, home to a forty-year-old experiment comparing organic and conventional agriculture, circulated a report claiming that more than 100 percent of current emissions could be offset through a global transition to regenerative organic farming. It seemed the world was ready to turn the carbon story of our food system on its head, transforming agriculture from a carbon source to a carbon sink.

Neuroscientists such as David Eagleman have done studies to examine the brain's internal clock. In one experiment, subjects watched a movie with fast-running cheetahs, with their legs coming off the ground, like Trinity in *The Matrix*. During the movie, a red dot of a fixed duration is flashed, when all four legs are suspended in midair. The same experiment is repeated with a small twist; in the second experiment, the same cheetah movie was played in slow motion, and the same annoying red dot blinked for the same duration as it had before when the cheetah caught air at normal speed. After the tests were compared, moviegoers believed that the red dot during the slow motion movie was shorter. "Your brain says I need to readjust my sense of time," said Eagleman. It shouldn't be surprising to consider that there might be a set of complex rules that governs how linguistic units are stuck together or organized. After all, in what other science do we not see the same principle at play? Consider chemistry. The basic building blocks are atoms which together form molecules. But you can't just take any old atoms and stick them together. Each molecule is made up of a very specific combination of a very specific set of atoms. Consider water: We know

that a water molecule is made up of two atoms of hydrogen and one of oxygen. Those amounts of those specific atoms follow some general principles of atom combination rules, and consequently, that type of molecule can exist. In introductory chemistry classes, a student learns the different elements of matter and what they're composed of, as well as learning the rules that govern how those elements/atoms are allowed to stick together. With that knowledge, they can begin to construct and deconstruct more complex organizations of matter.

We tend to think of specific vegetational or fuel types as all being more or less susceptible to fire. Yet what is also important is what makes up a particular vegetation or fuel complex. Take, for example, the northern boreal forests that are predominantly made up of large areas of coniferous trees. The burning history and susceptibility to fire has been found to vary across this community of plants. Recent research shows that the differences in the tree species composition in North American and Eurasian boreal forests explain the differences in fires. So, for example, the fires in North American boreal forests typically tend to be high-intensity crown fires. Many of these forests are dominated by a particular suite of conifers, including black spruce and jack pine. In contrast, the boreal forest fires in Eurasia, where the forests are dominated by spruce, Scots pine, and larch, tend to be low-intensity surface fires, with less severe impacts. This is why it is misguided for politicians to imagine that fire occurrence and methods of control in one region can necessarily be applied to another.

For instance, as a species, we may be getting smarter ③ because we live in cities, where urban culture is getting ever more complex, stimulating, and demanding. We almost certainly ④ are evolving to have different immune systems (and related physiological traits) as members of our species live in denser and denser aggregations, and as people move over ever longer distances between cities, which gives rise to new sorts of epidemics. For instance, (A) mutations appear to have recently arisen in our species that confer resistance to epidemics of typhoid newly ⑤ making possible by urbanization and long distance trade in Europe in the past few thousand years.

In European history, many of the song forms favored by the most popular performers were explicitly (1) connecting to dances. These origins are often preserved in the musical terminology we use today. The *rondo* is now treated as a specifically musical form with a recurring refrain, but the term likely derives from the circular dance that accompanied the *rondeau* of the wandering musicians of the late medieval era. Today we use the word carol to describe a Christmas song, but it comes from a very popular dance of that period, the carole. A host of other terms, from minuet to waltz, are now used to (2) describing concert hall music, but originated among dancers. I doubt we will ever grasp the full impact of dancing on musical style, which shows up even where we least expect to find it. Charles Rosen, in his seminal study *The Classical Style*, marvels over the process (3) which the four-bar phrase gained a “stranglehold on rhythmic structure” in classical music, and is forced to conclude that “the periodic phrase is related to the dance, with its need for a phrase pattern that corresponds to steps and to groupings.” In other words, even the elitist masterworks of Mozart and Beethoven move to the beat of the peasants’ feet.

Everyday anxiety is ① nothing surprising; we all experience worries, concerns, even moments of panic sometimes. But anxiety isn’t a binary proposition, like a light switch that’s on or off. Imagine instead a dimmer sliding up and down, sometimes quickly, other times hardly at all. Low-level anxiety is present in our lives so often, like the air we breathe, ② that we might not even notice it. It happens when we open the door to meet our new boss or when we look outside and see snow ③ coming down as we’re packing up for our drive home; suddenly we’re paying close attention to something we’d really rather not ④ to think about, but the feeling doesn’t last for more than a minute or two. Once I meet my new boss, I soon get a sense of ⑤ how she’s like and my anxiety subsides. As I start driving home, I see that the roads are still clear, so my worries ease. A well-known and puzzling paradox of psychophysical magnitude perception is that people are rather good at *discriminating* the intensity of different magnitudes, but remarkably ① poor at categorizing them absolutely. That is, (A) 사람들은 일반적으로 두 개의 소리 중 어느 소리가 더 큰소리인지를 구별할 수 있다, with an accuracy that would lead to the naive impression that they can tell the difference between of the order of a hundred different ② physical intensity levels. Yet when people are asked to explicitly associate intensity levels with category labels (e.g., 1 for the least intense stimulus, 2 for the next most intense, to, say, 7 for the most intense), they find this astonishingly ③ difficult. Rather than having of the order of a hundred or so different cognitive “bins” into which items can be reliably categorized, performance ④ soars when about *five* different intensity levels must be categorized. Critically, it matters very little either what the absolute intensity level of the items to be categorized actually is; or, more shockingly, what the range of those items is. That is, so long as the items are readily discriminable from each other, to a first approximation, all that matters is the ⑤ number of items that must be classified.

The prospect of a win-win solution for farmers and the planet rapidly attracted the attention of both media and industry onlookers, who began enthusiastically promoting such practices as “regenerative” agriculture. The French government challenged nations around the world to commit to (1) (increase) soil carbon by four-tenths of a percent per year, based on a scientific analysis (2) (show) that such an effort could offset 20 to 35 percent of greenhouse gas emissions caused by human activity. In conservative states like South Dakota and Mississippi, no-till farmers and holistic management ranchers — who rotate their animals in ways that mimic native animals that only eat plants — began proudly calling themselves “(A) carbon cowboys,” promoting large-scale investments from major companies. The Rodale Institute, home to a forty-year-old experiment compare organic and conventional agriculture, (3) (circulate) a report claiming that more than 100 percent of current emissions could be offset through a global transition to regenerative organic farming. It seemed the world was ready to turn the carbon story of our food system on its head, transforming agriculture from a carbon source to a carbon sink.

① The first question most people ask vegans and vegetarians is, “Where do you get your protein?” ② The prevalence of that question is a hangover from an earlier period, starting in the 1930s, when nutritionists believed we needed a high level of protein in our diet, and that a protein-deficient diet was a major cause of malnutrition. ③ A lack of protein was a problem among some people eating little else but the tropical root crop cassava — eaten in the West mainly in the form of tapioca — which contains less protein than any other major staple food. ④ But other malnourished people thought to be suffering from protein deficiency were in fact simply not getting enough calories. ⑤ The idea that we need high levels of protein was disproven in the 1970s, and health authorities reduced recommended protein intakes to about a third of what had been thought to be required. ⑥ These lower levels mean that for adults eating sufficient calories, even a diet consisting exclusively of bread, pasta, rice, or potatoes will provide adequate protein. ⑦ Children and pregnant and breast-feeding women need more protein, but that is easily provided by adding beans, peas, or lentils to basic staples like bread, pasta, or rice.

The first question most people ask vegans and vegetarians is, “Where do you get your protein?” The prevalence of that question is a hangover from an earlier period, starting in the 1930s, when nutritionists believed we needed a high level of protein in our diet, and ❶ that / which a protein-deficient diet was a major cause of malnutrition. A lack of protein was a problem among some people eating little else but the tropical root crop cassava — eaten in the West mainly in the form of tapioca — which contains ❷ more / less protein than any other major staple food. But other ❸ malnourished / well-nourished people thought to be suffering from protein deficiency were in fact simply not getting enough calories. The idea that we need high levels of protein was disproven in the 1970s, and health authorities reduced ❹ associated / recommended protein intakes to about a third of what had been thought to be required. These lower levels mean that for adults eating sufficient calories, even a diet ❺ consisting / depending exclusively of bread, pasta, rice, or potatoes will provide adequate protein. Children and pregnant and breast-feeding women need more protein, but that is easily provided by adding beans, peas, or lentils to basic staples like bread, pasta, or rice.

① One of the unhelpful consequences of the term "technological unemployment" is that it encourages us to think that the only (or at least the main) way that new technologies will affect the world of work is by changing the unemployment rate — the percentage of workers in the labor market who are looking for a job and cannot find one. ② That figure alone, though, does not capture the full picture. ③ To begin with, some people, facing the mismatches of skills, identity, and place, might simply give up on the job hunt and drop out of the labor market altogether. ④ If that were to happen, the official unemployment rate would actually fall: since those people were no longer searching for work, they would not count as being unemployed for the purposes of that statistic. ⑤ It is important, then, to also pay attention to what is known as the "participation rate": the percentage of people in the entire working-age population (not just those active in the labor market) who are employed. ⑥ In the United States today, for instance, the unemployment rate is an impressively low 3.7 percent. ⑦ At the same time, however, the participation rate has collapsed, falling to its lowest level since 1977. ⑧ More and more working-age Americans, it appears, are abandoning the world of work altogether — and that should be a cause for alarm. ⑨ Similarly, in the future, we should be cautious about focusing exclusively on the unemployment rate, and keep an eye on the participation rate as well.

① '기술에 의한 실업'이라는 용어의 무익한 결과 중 하나는 그것이 신기술이 직업 세계에 영향을 미칠 유일한 (혹은 적어도 주요한) 방식은 실업률, 곧 일자리를 구하고 있지만 찾을 수 없는 노동 시장의 노동자 비율을 바꾸는 것에 의해서라고 생각하도록 부추긴다는 것이다. ② 그러나 그 수치만으로는 전체 상황을 포착할 수 없다. ③ 우선 어떤 사람들은 기술, 정체성, 장소의 부조화에 직면하여 단순히 구직을 단념하고 노동 시장에서 완전히 중도 하차할 수도 있다. ④ 그런 일이 일어난다면 공식 실업률은 실제로 떨어질 것인데, 그 사람들은 더 이상 일자리를 구하지 않고 있기 때문에 그 통계의 목적상 실직한 것으로 간주되지 않을 것이다. ⑤ 따라서 '참가율'로 알려진 것에도 또한 주의를 기울이는 것이 중요한데, 이것은 (노동 시장에서 활동하는 사람들뿐만 아니라) 전체 노동 연령 인구에 있는 고용된 사람들의 비율이다. ⑥ 예를 들어, 오늘날 미국의 실업률은 3.7퍼센트로 놀랄 정도로 낮다. ⑦ 하지만, 그럼에도 불구하고 참여율은 붕괴되어 1977년 이후 최저 수준으로 떨어졌다. ⑧ 점점 더 많은 노동 연령의 미국인들이 직업의 세계를 완전히 포기하고 있는 것 같은데, 이는 걱정해야 할 이유가 되어야 한다. ⑨ 마찬가지로 앞으로 오로지 실업률에만 집중하는 것은 조심해야 하고, 참여율도 눈여겨봐야 한다.

In 1965, when the first electronic computers entered offices, Eric Hoffer warned in the *New York Times* that “a skilled population deprived of its sense and usefulness would be the ideal setup for an American Hitler.” Perhaps somewhat ironically, Hitler and his government were well ① aware of the disruptive force of labor-replacing technology. His appointment as chancellor of Germany on January 30, 1933, heralded the return of pre-industrial policies, which sought to ② restrict the use of machinery. In Danzig, where the Nazi Party won over 50 percent of the votes that year, such efforts became a major priority. To deal with the issue of technological ③ unemployment, the Senate decreed that machinery would not be installed in factories without special permission of the government. ④ Failure to comply would lead to heavy penalties or even being forced to shut down by the government. In August 1933, Alfred von Hodenberg, leader of the Nazi Labor Front, made clear that machines would not be allowed to ⑤ add workers’ jobs in the future. “Never again,” he reassured the public, “must the worker be replaced by a machine.”

Perhaps the most well-known example of _____ of the human brain is a study made in 2000 of London taxi drivers. London taxi drivers are renowned throughout the world for their detailed knowledge of the streets, configurations and one-way systems of central London. Most astonishing is that they have learnt all this information by heart and can navigate the streets of the big city, taking passengers from A to B without the aid of a manual. On average it takes a candidate driver two years to learn this massive amount of material, so that they can pass an ominous oral exam called ‘The Knowledge’. A text may depict a world that completely defies our empirical knowledge: a world with a different set of natural laws and human practices. Such imaginary worlds may, paradoxically, enhance understanding of fictionality since readers ① lack experience of them. Confronting a world that does not match our empirical knowledge, we intuitively perceive it as fiction, in the straightforward sense “not true,” and, as expert readers, do not put demands of ② credibility on them, which we tend to do with fictional worlds similar to the actual world. A novice reader’s response may be ③ acceptance, since the fictional world is perceived as untrue and therefore “inferior.” However, if part of the novice reader’s cognitive approach to learning is creative play, it makes imaginary worlds considerably more tangible and believable for them than for more ④ rational expert readers. Novice readers’ ⑤ limited experience of the actual world implies that they potentially more easily accept a wide range of fictional worlds without ascribing a greater degree of truth to any of them, thus taking a substantial cognitive leap from life to text.

The first question most people ask vegans and vegetarians is, “Where do you get your protein?” The prevalence of that question is a hangover from an earlier period, starting in the 1930s, when nutritionists believed we needed a high level of protein in our diet, and that a protein-deficient diet was a major cause of malnutrition. A lack of protein was a problem among some people eating little else but the tropical root crop cassava — eaten in the West mainly in the form of tapioca — which contains less protein than any other major staple food. But other malnourished people thought to be suffering from protein deficiency were in fact simply not getting enough calories. The idea that we need high levels of protein was disproven in the 1970s, and health authorities reduced recommended protein intakes to about a third of what had been thought to be required. These lower levels mean that for adults eating sufficient calories, even a diet consisting exclusively of bread, pasta, rice, or potatoes will provide adequate protein. Children and pregnant and breast-feeding women need more protein, but that is easily provided by adding beans, peas, or lentils to basic staples like bread, pasta, or rice.

One of the unhelpful consequences of the term “technological unemployment” is that it encourages us to think that the only (or at least the main) way that new technologies will affect the world of work is by changing the unemployment rate — the percentage of workers in the labor market who are looking for a job and cannot (a) find one. That figure alone, though, does not capture the full picture. To begin with, some people, facing the mismatches of skills, identity, and place, might simply give up on the job hunt and drop out of the labor market altogether. If that were to happen, the official unemployment rate would actually fall: since those people were no longer searching for work, they would not count as being (b) unemployed for the purposes of that statistic. It is important, then, to also pay attention to what is known as the “participation rate”: the percentage of people in the entire working-age population (not just those active in the labor market) who are employed. In the United States today, for instance, the unemployment rate is an impressively (c) high 3.7 percent. At the same time, however, the participation rate has (d) collapsed, falling to its lowest level since 1977. More and more working-age Americans, it appears, are abandoning the world of work altogether — and that should be a cause for (e) alarm. Similarly, in the future, we should be cautious about focusing exclusively on the unemployment rate, and keep an eye on the participation rate as well.

Humankind has sent rocket probes to Venus, Mars, Jupiter, and Saturn’s moon Titan and studied the planets and their moons with ground- and space-based instruments. All the planets except Mercury have atmospheres; so do all the larger moons except our own. The surfaces we observe have mountains and craters unless they are too soft to support such structures. Several moons are covered with deep layers of ice and one, Io, a moon of Jupiter, has sulfur volcanoes. Scientists have identified features both familiar and strange, but everything discovered is interpretable as the natural outcome of known chemistry and physics applied to conditions that resulted from those same laws acting on earlier conditions. The chain of explainable events

extends back to the beginning of time, and never do the explanations require conditions whose likelihood defies credibility. Improbable things happen and have happened throughout history. Science has not yet explained everything, but there is no persuasive evidence for the occurrence of miracles, of events so improbable that there is no reasonable expectation of them happening somewhere, sometime, in the lifetime of the universe.

The driving tension of the novel is the relationship between the materials of the story (plot, character, setting, theme, and so forth) and the narration of it in language; between the tale and the teller, in other words. The driving tension of film, on the other hand, is between the materials of the story and the objective nature of the image. It's as if the author/director of a film were in continual conflict with the scene he is shooting. Chance plays a much larger part, and the end result is that the observer is free to participate in the experience much more actively. In artistic creativity, the example of the work of the Post-Impressionist painter Paul Cézanne demonstrate the difference between combination or merger and the development of integration. Cézanne is often considered the artist whose work launched the artistic era widely designated as “Modern Art,” comprising the styles and artworks of Picasso, Braque, Matisse and many others. He brought the earlier Impressionist style of painting, in which form was dissolved into light and color, together with form as constructed or structural. This French painter, at the end of the 19th and the beginning of the 20th centuries, produced a new artistic mode within a movement known as Post-Impressionism. His work was functionally separate from and at the same time connected with the Impressionists. He painted their favorite types of bright land, seascapes, and ordinary household scenes and emphasized strong geometric underpinnings and shapes. He considered these shapes to display ideal forms in natural things. In his new mode, in paintings such as *The Bathers*, colors, hues and lighting, geometric shapes, and textures were integrated into a whole. These artistic creations inspired the work of the Modernists and many generations of artists after him.

In 1965, when the first electronic computers entered offices, Eric Hoffer warned in the *New York Times* that “a skilled population deprived of its sense and usefulness would be the ideal setup for an American Hitler.” Perhaps somewhat ironically, Hitler and his government were well aware of the disruptive force of labor-replacing technology. His appointment as chancellor of Germany on January 30, 1933, heralded the return of pre-industrial policies, which sought to restrict the use of machinery. In Danzig, where the Nazi Party won over 50 percent of the votes that year, such efforts became a major priority. To deal with the issue of technological unemployment, the Senate decreed that machinery would not be installed in factories without special permission of the government. Failure to comply would lead to

heavy penalties or even being forced to shut down by the government. In August 1933, Alfred von Hodenberg, leader of the Nazi Labor Front, made clear that machines would not be allowed to threaten workers’ jobs in the future. “Never again,” he reassured the public, “must the worker be replaced by a machine.”

A text may depict a world that completely defies our empirical knowledge: a world with a different set of natural laws and human practices. Such imaginary worlds may, paradoxically, enhance understanding of fictionality since readers lack experience of them. ① Confronting a world that does not match our empirical knowledge, we intuitively perceive it as fiction, in the straightforward sense “not true,” and, as expert readers, do not put demands of credibility on them, which we tend to do with fictional worlds similar to the actual world. ② A novice reader’s response may be rejection, since the fictional world is perceived as untrue and therefore “inferior.” ③ The problem is that the response leaves one’s level of reading at the novice level, which can only be raised to an expert level through reading a much wider range of topics. ④ However, if part of the novice reader’s cognitive approach to learning is creative play, it makes imaginary worlds considerably more tangible and believable for them than for more rational expert readers. ⑤ Novice readers’ limited experience of the actual world implies that they potentially more easily accept a wide range of fictional worlds without ascribing a greater degree of truth to any of them, thus taking a substantial cognitive leap from life to text.

These lower levels mean that for adults eating sufficient calories, even a diet consisting exclusively of bread, pasta, rice, or potatoes will provide adequate protein.

The first question most people ask vegans and vegetarians is, “Where do you get your protein?” (①) The prevalence of that question is a hangover from an earlier period, starting in the 1930s, when nutritionists believed we needed a high level of protein in our diet, and that a protein-deficient diet was a major cause of malnutrition. (②) A lack of protein was a problem among some people eating little else but the tropical root crop cassava — eaten in the West mainly in the form of tapioca — which contains less protein than any other major staple food. (③) But other malnourished people thought to be suffering from protein deficiency were in fact simply not getting enough calories. (④) The idea that we need high levels of protein was disproven in the 1970s, and health authorities reduced recommended protein intakes to about a third of what had been thought to be required. (⑤) Children and pregnant and breast-feeding women need more protein, but that is easily provided by adding beans, peas, or lentils to basic staples like bread, pasta, or rice.

Humankind has sent rocket probes to Venus, Mars, Jupiter, and Saturn’s moon Titan and studied the planets and their moons with ground- and space-based instruments. All the planets except Mercury have atmospheres; so do all the larger moons except our own. The surfaces we observe have mountains and craters unless they

are too soft to support such structures. Several moons are covered with deep layers of ice and one, Io, a moon of Jupiter, has sulfur volcanoes. Scientists have identified features both familiar and strange, but everything discovered is interpretable as the natural outcome of known chemistry and physics applied to conditions that resulted from those same laws acting on earlier conditions. The chain of explainable events extends back to the beginning of time, and never do the explanations require conditions whose likelihood defies credibility. Improbable things happen and have happened throughout history. In artistic creativity, the example of the work of the Post-Impressionist painter Paul Cézanne demonstrate the difference between combination or merger and the development of integration. Cézanne is often considered the artist whose work launched the artistic era widely designated as “Modern Art,” comprising the styles and artworks of Picasso, Braque, Matisse and many others. He brought the earlier Impressionist style of painting, in which form was dissolved into light and color, together with form as constructed or structural. This French painter, at the end of the 19th and the beginning of the 20th centuries, produced a new artistic mode within a movement known as Post-Impressionism. His work was functionally separate from and at the same time connected with the Impressionists. He painted their favorite types of bright land, seascapes, and ordinary household scenes and emphasized strong geometric underpinnings and shapes. He considered these shapes to display ideal forms in natural things. In his new mode, in paintings such as *The Bathers*, colors, hues and lighting, geometric shapes, and textures were integrated into a whole. These artistic creations inspired the work of the Modernists and many generations of artists after him.

One of the unhelpful consequences of the term “technological unemployment” is that it encourages us to think that the only (or at least the main) way that new technologies will affect the world of work is by changing the unemployment rate — the percentage of workers in the labor market who are looking for a job and cannot find one. That figure alone, though, does not capture the full picture. To begin with, some people, (A) face the mismatches of skills, identity, and place, might simply give up on the job hunt and drop out of the labor market altogether. If that (B) was to happen, the official unemployment rate would actually fall: since those people were no longer searching for work, they would not count as being unemployed for the purposes of that statistic.

It is important, then, to also pay attention to (C) which is known as the “participation rate”: the percentage of people in the entire working-age population (not just those active in the labor market) who are employed. In the United States today, for instance, the unemployment rate is an impressively low 3.7 percent. At the same time, however, the participation rate has collapsed, falling to its lowest level since 1977. More and more working-age Americans, it appears, are abandoning the world of work altogether — and that should be a cause for alarm. Similarly, in the future, we should be cautious about focusing exclusively on the unemployment rate, and keep an eye on the participation rate as well.

Each year, the forest manager must decide whether or not to harvest a particular stand of trees or to wait for the additional growth. In contrast to many other living resources, however, the time period between initial investment (planting) and recovery of that investment (harvesting) is especially long. Intervals of 25 years or more are common in forestry, but not in many other industries. Finally, forestry ❸ _____ (~의 영향을 받다) an unusually large variety of externalities, which ❹ _____ (~과 관련되다) either the standing timber or the act of harvesting timber. ① In Europe, wagons seem to have been used primarily for agriculture. ② It seems unlikely that they were used to transport loads over long distances — something that requires relatively flat, open country or well-maintained trackways. ③ Early wagons lacked steering, and they also required care and maintenance. ④ Repairing a broken wheel or axle would have required woodworking tools and would have been difficult to do while out and about. ⑤ So early wagons would probably have had quite a limited operating range. ⑥ In Europe, their use may have been restricted to short local trips within a particular farm or community, for example to transport animal waste fertilizer into the fields and carry harvests and firewood into villages.

⑦ On the plains around the north and east of the Black Sea, however, the herders of the Pontic steppe found quite a different use for these vehicles: as mobile homes. ⑧ Using wagons to carry food, supplies, and other possessions allowed nomads to move deep into the open steppe with their herds of cattle and sheep. ⑨ These wagons moved slowly, at walking pace. ⑩ Their cultural significance is apparent from the appearance of “wagon graves,” which have a wheel buried in each corner, so that the grave itself forms a kind of wagon, carrying its occupant into the afterlife. ⑪ Such graves first appeared on the Black Sea plains around 3300 B.C.E. ⑫ The distinctive tradition of wagon nomadism in this region persisted for thousands of years; it was mentioned by the Greek historian Herodotus in the fifth century B.C.E., was adopted by the Mongols in the thirteenth century C.E., and survived into the modern era.

① 유럽에서 수레는 주로 농경을 위해 사용되었던 것으로 보인다. ② 수레가 장거리로 짐을 수송하는 데 사용되었던 것 같지는 않은데, 그것은 비교적 평평하고 탁 트인 지역이나 잘 유지되는 길을 필요로 하는 일이다. ③ 초기의 수레는 방향 전환 장치가 없었으며, 관리와 유지도 필요했다. ④ 부서진 바퀴나 굴대 수리는 목공구를 필요로 했을 것이고 돌아다니는 동안에는 하기가 어려웠을 것이다. ⑤ 그래서 초기의 수레는 아마도 아주 제한된 운용 범위를 가졌을 것이다. ⑥ 유럽에서, 그것의 사용은, 가령 들로 동물 배설물 거름을 수송하기 위해서 그리고 수확물과 장작을 마을로 나르기 위해서, 특정 농장이나 지역 사회 내에서의 짧고 국지적인 이동에 제한되었을지도 모른다.

⑦ 하지만 흑해의 북쪽과 동쪽 주변의 평원에서, 흑해 스텝 지대 목축민들은 이 운송 수단의 상당히 다른 용도를 알아냈는데, 그것은 이동식 집으로였다. ⑧ 먹물 것, 물자, 그리고 다른 소유물을 나르기 위해 수레를 사용하는 것은 유목민이 소 떼와 양 떼를 데리고 탁 트인 스텝 지대로 깊숙이 이동하는 것을 가능하게 했다. ⑨ 이 수레들은 천천히, 도보 속도로 움직였다. ⑩ 수레의 문화적 중요성은 ‘수레 무덤’의 출현으로 보아 분명한데, 그곳에는 각 모퉁이에 매립된 바퀴가 있어서 무덤 자체가 일종의 수레가 되어 무덤에 안치된 사람을 사후 세계로 실어 나른다. ⑪ 그런 무덤은 기원전 3300년 무렵에 흑해 평원에 처음 나타났다. ⑫ 이 지역의 수레 유목 생활의 독특한 전통은 수천 년 동안 지속되었는데, 기원전 5세기에 그리스 역사가 Herodotus에 의해 언급되었고, 서기 13세기에 몽골족에 의해 채택되어 근대까지 존속하였다.

It is not remarkable that competing economic theories exist to explain the same phenomena, with economists disagreeing as to which theory is to be preferred. Much has been written about the uncertain accuracy of economists' predictions. While economists can foretell the effects of specific changes in the economy, they are better at predicting the direction rather than the actual magnitude of events. When economists predict that a tax cut will raise national income, one may be confident that the prediction is accurate; when they predict that it will raise national income by a certain amount in three years, however, the forecast is likely to miss the mark. The reason is that most economic models do not contain any explicit reference to the passage of time and hence have little to say about how long it takes for a certain effect to make itself felt. Short-period predictions generally fare better than long-period ones.

- ② the gap between economists' judgments and the real economy
- ③ the effects of economists' predictions on the market economy

Soon after it ① emerged on Earth, life started to capture energy from the Sun through photosynthesis. This chemical reaction is a delicately crafted dance that is led by high-energy photons from the Sun. These are used by chloroplasts to drive a series of reactions that produce sugars. The very first forms of photosynthesis used water and elements such as sulphur to complete the process, but while water was abundant, the relative ② abundance of sulphur meant that photosynthesis was limited. However, concentrations of carbon dioxide were more than ten times higher than they are today, and over a period of some 800 million years, early life evolved the capability to use this more ③ common gas for photosynthesis. No longer dependent on ④ scarce elements, life on Earth flourished. The absence of the face-to-face cues that normally guide our offline interactions can _____ in cyberspace, also contributing to disinhibition in the virtual world. An e-mail from somebody might be experienced as an internal voice in our head. "When reading another's message, one might also 'hear' the online companion's voice using one's own voice," Dr. John Suler writes. People often move their lips or make speech sounds as they read, which can make them project their own voice into the other person's text. The result can be that the conversation is experienced as taking place in one's own head, much more a soliloquy than the dialog that it really is between two separate entities. Since talking to oneself is generally considered safer than talking to someone else, the result is more indiscriminate openness and less responsible disclosures, not to mention a dissolution of boundaries between "self" and the "other." This dissolution does not help our universal goal of psychological independence and healthy autonomy.

Smart cities are definitely nudging the world toward some sustainability goals, and smart technologies are visibly improving city services within some fast-growing economies, most notably China. But incrementally improving the management of electrical grids, pollution and waste, transportation, and city services can take the world only a short distance toward global sustainability. Smart city technologies do very little to alter and can even (a) worsen problems such as wasteful consumption, feelings of alienation, income inequality, housing prices, inequity of services, and privacy rights. The positive discourse of smart cities can also (b) reveal the ways that the political and economic structures of cities themselves have long been a cause of global environmental degradation.

Ecologist William Rees, who coined the term “ecological footprint,” reminds us of the complex ways that cities and the accompanying suburban sprawl draw down global resources and harm distant ecosystems. Urban economics, as he demonstrates, tends to (c) exaggerate the value of urbanization for sustainability by underestimating the global environmental damage from the rising consumption of city residents. Most cities rely on land, food, fresh water, natural resources, and energy far beyond their borders. And they rely on (d) externalizing the cost of waste into distant lands, the global commons, and future generations. Measured locally, the ecological footprint of the residents of a smart city may seem to be declining. But taking into account the shadows of consumption in faraway lands, this footprint looks very (e) different, with deep social and environmental costs for marginalized peoples and fragile ecosystems.

Trust in payment systems is imperative for the smooth functioning of a modern economy. When you pay for a cappuccino with a five-dollar bill, that transaction is instantly authenticated, as it is intermediated through cash. It is also final and irreversible once the bill goes into the cash register and you walk out of the coffee shop. Ensuring the finality and irreversibility of payments is less straightforward with electronic payment systems because there is no tangible element to the transaction. Still, if you were to use a debit or credit card instead of cash, the coffee shop can be confident that it would get paid and that you could not reverse the transaction after consuming the cappuccino. Compasses have just one purpose — to tell the user where north is. Armed with such a tool, a naive juvenile bird should always be able to use north as a reference point, and then orientate itself by rotating its body to a point where it is in line with whatever desired migratory heading it has inherited from its parents. This basic compass orientation is thought to be the cornerstone of migration in naive juvenile birds and has been the subject of exhaustive scientific study. For decades, researchers have performed increasingly complex and elegant experiments to examine how birds ‘read’ their internal compass, and how they then use this information to orientate themselves. Many of these experiments have involved trapping wild birds (or raising them in the lab) and placing them in a cage apparatus overnight, where their desired target orientation can be evaluated from the pattern of marks they leave around the edges of the cage. By manipulating the information available to these birds — for example, by preventing them from seeing the stars above — researchers have been able to painstakingly unpick the different cues that birds use to orientate themselves.

Soon after it emerged on Earth, life started to capture energy from the Sun through photosynthesis. This chemical reaction is a delicately crafted dance that is led by high-energy photons from the Sun. (A) These are used by chloroplasts to drive a series of reactions that produce sugars. The very first forms of photosynthesis used water and elements such as sulphur to complete the process, but while water was abundant, the relative scarcity of sulphur meant that photosynthesis was limited. However, concentrations of carbon dioxide 현재보다 열 배 이상 높았었다, and over a period of some 800 million years, early life evolved the capability to use this more common gas for photosynthesis. No longer dependent on (B) scarce elements, life on Earth flourished. As it did, the oxygen produced as a by-product of photosynthesis transformed the biosphere, with a series of 'pulses' increasing the concentration of oxygen in the atmosphere from under 1 per cent to today's level of 21 per cent.

The _____ (A) of the face-to-face cues that normally guide our offline interactions can erase boundaries among people in cyberspace, also contributing to disinhibition in the virtual world. An e-mail from somebody might be experienced as an internal voice in our head. "When reading another's message, one might also 'hear' the online companion's voice using one's own voice," Dr. John Suler writes. People often move their lips or make speech sounds as they read, which can make them project their own voice into the other person's text. The result can be that the conversation is experienced as taking place in one's own head, much more a(n) _____ (B) than the dialog that it really is between two separate entities. Since talking to oneself is generally considered safer than talking to someone else, the result is more indiscriminate openness and less responsible disclosures, not to mention a(n) _____ (C) of boundaries between "self" and the "other." This dissolution does not help our universal goal of psychological independence and healthy autonomy.

Smart cities are definitely nudging the world toward some sustainability goals, and smart technologies are visibly improving city services within some fast-growing economies, most notably China. But incrementally ① improve the management of electrical grids, pollution and waste, transportation, and city services can take the world only a short distance toward global sustainability. Smart city technologies do very little to alter and can even worsen problems such as wasteful consumption, feelings of alienation, income inequality, housing prices, inequity of services, and privacy rights. The positive discourse of smart cities can also obscure the ways that the political and economic structures of cities themselves have long been a cause of global environmental degradation.

Ecologist William Rees, who coined the term “ecological footprint,” reminds us of the complex ways that cities and the accompanying suburban sprawl draw down global resources and harm distant ecosystems. Urban economics, as he demonstrates, tends to exaggerate the value of urbanization for sustainability by underestimating the global environmental damage from the rising consumption of city residents. Most cities rely on land, food, fresh water, natural resources, and energy far beyond their borders. And they rely on externalizing the cost of waste into distant lands, the global commons, and future generations. ② Measure locally, the ecological footprint of the residents of a smart city may seem to be declining. But ③ take into account the shadows of consumption in faraway lands, this footprint looks very different, with deep social and environmental costs for marginalized peoples and fragile ecosystems.

Most termites are manual laborers. Blind and wingless, they maintain and build core civic structures, ensure the citywide climate-control systems are operating optimally, and feed and water those in other professions — the soldiers and the reproductives. (A) They are also tasked with managing the inner-city fungus farms on which their colonies depend. 여왕 개미의 방 바로 아래에 위치해 있는데, the fungus farms are where termites produce the food that sustains a colony. Every night the workers leave the mound on foraging expeditions, returning only when their guts are packed with grass and wood chips. When they make it back to the mound they head to the farming chambers. There, (B) they defecate the partially digested wood and grass, and set about molding this into maze-like structures seeded with fungal spores. Trust in payment systems is imperative for the smooth functioning of a modern economy. When you pay for a cappuccino with a five-dollar bill, that transaction is instantly authenticated, as it is intermediated through cash. It is also final and irreversible once the bill goes into the cash register and you walk out of the coffee shop. (A) Ensured the finality and irreversibility of payments is less straightforward with electronic payment systems because there is no tangible element to the transaction. Still, if you (B) are to use a debit or credit card instead of cash, the coffee shop can be confident that it would get paid and that you could not reverse the transaction after consuming the cappuccino. Farming gave farmers more than just food, wood, and fibers. It also gave them indirect access to new flows of energy. For example, humans cannot eat grass, but horses and oxen can, so farmers who let horses and oxen graze and then used them for riding or haulage or killed and ate them (A) tapping into the large flows of photosynthetic energy through grasslands. Compasses have just one purpose — to tell the user where north is. This basic compass (A) _____ is thought to be the cornerstone of migration in naive juvenile birds and has been the subject of exhaustive scientific study. For decades, researchers have performed increasingly complex and elegant experiments to examine how birds ‘read’ their internal compass, and how they then use this information to orientate themselves. Many of these experiments have involved trapping wild birds (or raising them in the lab) and placing them in a cage apparatus overnight, where their desired target (B) _____ can be evaluated from the pattern of marks they leave around the edges of the cage. In Europe, 수레는 주로 농경을 위해 사용되었던 것으로 보인다. It seems unlikely that they were used to transport loads over long distances — something that requires relatively flat, open country or well-maintained trackways. Early wagons lacked ① steering, and they also required care and maintenance. Repairing a broken wheel or axle would have required woodworking tools and would have been difficult to do while out and about. So early wagons would probably have had quite a limited operating range. In Europe, their use may have ② restricted to short local trips within a particular farm or community, for example to transport animal waste fertilizer into the fields and carry harvests and firewood into villages. On the plains around the north and east of the Black Sea, however, the herders of the Pontic steppe found quite a different use for these vehicles: as mobile homes. ③ Using wagons to carry food, supplies, and other possessions allowed nomads to move deep into the open steppe with their herds of cattle and sheep. These wagons moved slowly, at walking pace. Their cultural significance is apparent from the appearance of “wagon graves,” which have a wheel ④ burying in each corner, so that the grave itself forms a kind of wagon, carrying its occupant into the afterlife. Such graves first ⑤ was appeared on the Black Sea plains around 3300 B.C.E. The distinctive tradition of wagon nomadism in this region persisted for thousands of years; it was mentioned by the Greek historian Herodotus in the fifth century B.C.E., was adopted by the Mongols in the thirteenth century C.E., and survived into the modern era.

① 영국의 화가 John C. Horsley가 1843년경에 최초의 인쇄된 크리스마스 카드를 디자인한 것으로 일반적으로 여겨진다. ② 더 먼저, William Egley가 대신 그 명예에 대한 권리를 가질 수도 있는데, 그의 카드에 있는 불분명한 날짜가 다른 가능성인 ‘1849’라기보다는 ‘1842’로 읽힌다면 말이다. ③ Horsley의 창작물은 영국 신사인 Henry Cole 경에 의해 의뢰되었는데, 그는 예법에 따라 자신의 많은 친구에게 크리스마스 시즌 인사 편지를 보내야 했을 때 대신 카드를 보내기로 결정했다. ④ 3x5인치 크기의 컬러로 된 Horsley 카드에서 눈에 잘 띄는 가운데 그림이 독한 술을 마시고 있는 행복한 대가족의 모습을 보여 주었다. ⑤ 아래에는 “즐거운 크리스마스와 행복한 새해 보내세요.”라고 쓰인 캡션이 있었고, 두 개의 측면 그림이 성경 속 장면들을 묘사했는데, “벌거벗은 자들에게 입을 옷을 마련해 줄 것”과 “굶주린 자들에게 먹을 것을 줄 것”이라는 타이틀이 붙어 있었다. ⑥ 종교적인 그림들에도 불구하고, 일부 더 독실한 시민들은 그 카드가 술에 빠짐을 조장한다고 주장하면서 가운데 그림에 강력하게 이의를 제기했다. ⑦ 그 카드는 1,000부 한정판으로 발행되었으며, 장당 1실링에 판매되었다. ⑧ Horsley 이후, 다양한 카드 제조사들이 크리스마스 카드를 전문품 외의 상품으로 자신들의 물품 목록에 추가했는데, Marcus Ward and Company가 1867년에 크리스마스 시즌 인사 카드를 발행하면서 선두에 섰다.

① Mass interactive media make for many unintended consequences, and the Streisand effect summarizes one of the most central: ② other people won't always do what you want them to, and efforts to dictate their behavior can rebound rather messily. ③ The effect takes its name from beloved American singer and actress Barbra Streisand, who in 2003 sued a company and photographer involved in the California Coastal Records Project, on the grounds that one of their photographs was an aerial image in which her house could clearly be seen. ④ The photograph, she argued, violated her privacy — an argument that was ultimately unsuccessful. ⑤ Far more significant than her lack of legal success, however, was the quite staggering lack of success Streisand enjoyed in attempting to preserve her privacy by suppressing the image of her home. ⑥ As Wikipedia points out, before her actions drew attention to the image, it had been downloaded just six times from the website of the photographer who took it. ⑦ Thanks to the legal case, however, over 400,000 people visited the site over the following month (and the image remains prominently reproduced across the web). ⑧ The term 'Streisand effect' itself was coined on the Techdirt blog in 2005, looking back on its coverage of the 2003 incident and at the way in which Streisand's actions had fueled an internet-led movement doing precisely the opposite of what she wanted.

(그리고 그 사진은 웹 곳곳에서 대문짝만하게 복제되어 남아 있다.) ⑧ 'Streisand 효과'라는 용어 자체는 2005년에 Techdirt 블로그에서 2003년 사건에 대한 그것의 보도와, Streisand의 소송이 그녀가 원한 것과 정확히 반대되는 일을 하는 인터넷 주도의 운동을 자극했던 방식을 되돌아보며 만들어졌다.

Mass interactive media make for many unintended consequences, and the Streisand effect summarizes one of the most central: other people won't always do what you want them to, and efforts to dictate their behavior can rebound rather ❶ messy / messily. The effect takes its name from beloved American singer and actress Barbra Streisand, who in 2003 ❷ sued / suited a company and photographer involved in the California Coastal Records Project, on the grounds that one of their photographs was an aerial image in which her house could clearly be seen. The photograph, she argued, violated her privacy — an argument ❸ that / what was ultimately unsuccessful. Far more significant than her lack of legal success, however, was the quite staggering lack of success Streisand enjoyed in attempting to preserve her privacy by ❹ exposing / suppressing the image of her home. As Wikipedia points out, before her actions drew attention to the image, it had been downloaded just six times from the website of the photographer who took it. Thanks to the legal case, however, over 400,000 people visited the site over the following month (and the image remains ❺ prominent / prominently reproduced across the web). The term 'Streisand effect' itself was coined on the Techdirt blog in 2005, looking back on its coverage of the 2003 incident and at the way in which Streisand's actions ❻ has fueled / had fueled an internet-led movement doing precisely the opposite of what she wanted.

① Recent studies have shown how firms' increased tendency to copy best practice from competitors has led to declining margins as products and services become increasingly homogeneous and companies are left to compete on price. ② Indeed, a similar trend may be occurring in all fields of knowledge. ③ A recent study published in the scientific journal *Science* showed that a tendency to read and cite only the latest research rather than scan more widely for interesting connections may be behind a decline in breakthrough thinking. ④ So how do you encourage 'next practice' innovation that doesn't get bogged down in the detail of what is happening today and just reproduce what has gone before, but without straying away from the fundamentals?

⑤ It is no coincidence that many of the most innovative new car designs have been conceptualized as they were sketched. ⑥ The Land Rover's iconic shape was born in 1947. ⑦ Rover's technical director, Maurice Wilks, was holidaying in Anglesey, where he was using an army surplus Willys Jeep as a utility vehicle. ⑧ Impressed by its abilities, Wilks wondered if a civilian version would boost Rover's stagnant post-war sales. ⑨ With a stick in the sand, he outlined his concept behind the car. ⑩ Similarly, while the story that the Mini took shape on the back of a napkin isn't quite correct (Alec Issigonis only used high-quality paper), its revolutionary design was worked out in pencil sketches.

⑪ One powerful aspect of thinking strategically and innovatively by drawing in this way is that it can be detached from 'the database' of the past while still being grounded. ⑫ An experienced draftsman or engineer with a clean sheet can draw unhindered by the weight of what is currently in fashion, while her knowledge of the fundamentals keeps her from going completely off-beam. ⑬ So often in modern organizations, the ease with which current information is at one's fingertips lengthens the research process and often ends up promoting views that are heavily influenced by current 'best practice' trends, stifling real involvement in particular problems and, hence, real innovation.

① 최근의 연구들은 경쟁사들의 모범 사례를 모방하려는 기업들의 경향 증가가 제품과 서비스가 점점 동질화되고 기업들이 가격을 두고 경쟁하는 상황에 놓임에 따라 어떻게 수익 감소로 이어졌는지를 보여 주었다. ② 실제로, 유사한 추세가 모든 지식 분야에서 아마 일어나고 있을 것이다. ③ 과학 저널 *Science*에 발표된 최근의 한 연구는 흥미로운 연관성을 찾기 위해 더 광범위하게 검색하기보다 최신 연구만 읽고 인용하는 경향이 획기적인 사고 감소의 배후에 있을 수 있다는 것을 보여 주었다. ④ 그렇다면 어떻게 하면 오늘날 일어나고 있는 것의 세부 사항에 발목을 붙잡혀 이전에 성공했던 것을 단지 재현하는 것이 아니면서, 기본에서 벗어나지 않는 '다음의 방안' 혁신을 장려할 수 있을까?

⑤ 가장 혁신적인 신차 디자인 중 상당수가 스케치 되었기 때문에 개념화 되었다는 것은 우연이 아니다. ⑥ Land Rover의 상징이 된 형태는 1947년에 탄생했다. ⑦ Rover의 기술 이사인 Maurice Wilks는 Anglesey에서 휴가를 보내고 있었는데, 거기서 그는 불용 군수품 Willys Jeep를 다용도 차량으로 사용하고 있었다. ⑧ 그것의 성능에 감명을 받은 Wilks는 민간용 버전이 Rover의 침체된 전쟁 후 판매를 증가시키지 않을까 싶었다. ⑨ 그는 막대기를 가지고 모래에 그 자동차에 대한 자신의 개념의 윤곽을 그렸다. ⑩ 마찬가지로 Mini가 넓킨 뒷면에서 구체화되었다는 이야기는 완전히 정확하지는 않지만(Alec Issigonis는 고급 종이만 사용했다.) 그것의 혁신적인 디자인은 연필 스케치로 고안되었다.

⑪ 이러한 방식으로 그림을 그림으로써 전략적이고 혁신적으로 사고하는 것의 한 가지 강력한 측면은 그것이 여전히 근거를 두고 있으면서도 과거의 '데이터베이스'에서 분리될 수 있다는 것이다. ⑫ 숙련된 설계자나 엔지니어는 백지 한 장을 가지고 현재 유행하고 있는 것의 무게에 방해받지 않고 그릴 수 있지만, 기본 사항에 대한 자신의 지식으로 인해 완전히 잘못되지는 않는다. ⑬ 너무나 자주 현대 조직에서는 최신 정보를 즉시 이용할 수 있는 용이성이 연구 과정을 길게 늘리고, 흔히 결국 현재의 '모범 사례' 유행에 크게 영향을 받는 견해를 조장하여 특정 문제에 대한 진정한 물두름, 따라서 진정한 혁신을 억제한다.

① 미국의 현재 환경 정책과 규제들은 대부분이 기후 변화가 산림 자원에 영향을 미치는 요소로 인식되기 전에 개발된 것이어서, 급변하는 기후와 교란 체제를 수용하기에 충분히 유연하지 못할 수도 있다. ② 예를 들어, 산불을 진압할 기관의 역량(예산과 인력)은 이미 부담을 받고 있다. ③ 2000년 이후 미국 산림청은 일반적으로 연간 10억~20억 달러를 화재 진압에 지출해 왔으며, 기관 전체 예산의 거의 50퍼센트가 현재 화재 관리에 할당되어 있다. ④ 대부분의 모델링 연구에서 보수적으로 예측한 바인데, 만약 연간 연소 면적이 21세기 동안 두 배로 증가하면, 기관 예산이 크게 증가하지 않는 상황에서 다른 관리 기능과 대비해서 화재 진압의 균형을 맞추는 것이 중요한 정책 이슈가 될 것이다. ⑤ 연료 관리가 화재 강도를 줄이고 산불에 대한 환경 회복력을 증진시킨 하지만, 사전 예방적이고 전략적으로 이루어지는 관리를 위한 예산을 크게 늘리지 않고는 증가하는 화재 진압 비용을 상쇄하기 어려울 것이다.

① 유명 음악가 Paganini가 오케스트라와 협연할 때 그는 자신의 바이올린을 다른 악기들보다 1/4음 높게 조율해서 자신의 바이올린 소리가 오케스트라보다 반드시 더 크게 들리도록 했다. ② 이렇게 음의 높이를 높이는 것은 그의 연주가 곡조가 틀리게 들릴 정도는 아니었지만, 그가 내는 음이 실제로 오케스트라의 백화모니(화음 반주)를 넘어 뚫고 나갈 수 있도록 해 주었다. ③ 이 기술은 시끄러운 주변 소음보다 더 크게 신호를 보낼 필요가 있는 몇몇 동물에 의해 이용된다. ④ 동남아시아의 열대 우림에는 그것의 날카로운 울음소리가 다른 곤충들의 불협화음보다 날카롭고 더 높은 주파수의 소리로 크게 들리기 때문에 우리가 ‘chainsaw insect(쇄사슬톱 벌레)’라고 부르는 곤충이 있다. ⑤ 들리는 것뿐 아니라 보이는 것도 숲에서는 특별한 문제인데, 왜냐하면 단지 특정한 시각적 신호만이 뾰뚱한 숲의 아롱지고 변화하는 빛 속에서 그리고 덩굴, 줄기, 나뭇잎으로 형성된 복잡한 패턴을 배경으로 해서 쉽게 보일 수 있기 때문이다. ⑥ 만약 여러분이 그런 ‘요란한’ 시각적 환경에서 시각적 신호를 보내고 싶다면, 흑백의 줄무늬나 조각을 보여 주는 것은 무의미할 것이다. ⑦ 얼룩말은 덩굴 옆이나 아래의 아롱진 빛에 가만히 서 있을 때 실제로 흑백 줄무늬로 위장된다. ⑧ 흑백 무늬는 효과적인 위장이 되어, 그것[신호]을 받는 대상은 그것이 그 무늬를 더 뚜렷하게 만드는 움직임을 수반하지 않는다면, 그런 무늬를 사용하는 것에 의존하는 신호를 탐지할 가능성이 없을 것이다. ⑨ 그렇기에 숲의 많은 종이 시각적 신호를 보내는 데 사용되는 그러한 신체 부위에 밝은 빛깔을 띠는 것은 놀라운 일이 아니다.

Further, William Egley may have claim to the (A) honor / shame instead, should an obscure date on his card read “1842” rather than the other possibility of “1849.” Horsley’s creation was commissioned by Sir Henry Cole, an English gentleman who, when etiquette dictated that he send seasonal notes to his numerous friends, elected instead to send cards. On the colored, 3-by-5-inch Horsley card, a prominent center panel displayed a large, happy family consuming spirits. The card was issued as a limited edition of a thousand copies, which sold for a shilling each. After Horsley, various card manufacturers added Christmas cards to their inventory as a sideline, Marcus Ward and Company achieving the forefront with their publication of seasonal greeting cards in 1867.

Contests between virtuous and bad characters, between wilfulness and duty, make for dramatic television, but the fundamental idea in utilitarianism of maximising pleasure for the greatest number and minimising pain for as many as possible, does not generate much dramatic action. Drama tends to revolve around the actions and choices of individual characters rather than the consequences for people in general; to create a utilitarian drama would be rather dull, if only because the most important activity would be the invisible mental one of calculating the consequences of actions. Utilitarian philosophy is _____, especially documentary and news programmes in which the ‘greater good’ is often spelt out through the way that actual worldly events are framed and reported. Such programmes take it for granted that viewers share with the producers a desire to minimise pain and suffering while maximising pleasure amongst all. Such a presumption underpins programmes reporting, for example, distant suffering caused by war, flood, famine, earthquake or poverty.

Mass interactive media make for many unintended consequences, and the Streisand effect summarizes one of the most central: other people won't always do what you want them to, and efforts to dictate their behavior can rebound rather messily. The effect takes its name from beloved American singer and actress Barbra Streisand, who in 2003 sued a company and photographer involved in the California Coastal Records Project, on the grounds that one of their photographs was an aerial image in which her house could clearly be seen. The photograph, she argued, violated her privacy — an argument that was ultimately unsuccessful. Far more significant than her lack of legal success, however, was the quite staggering lack of success Streisand enjoyed in attempting to preserve her privacy by suppressing the image of her home. As Wikipedia points out, before her actions drew attention to the image, it had been downloaded just six times from the website of the photographer who took it. Thanks to the legal case, however, over 400,000 people visited the site over the following month (and the image remains prominently reproduced across the web). The term 'Streisand effect' itself was coined on the Techdirt blog in 2005, looking back on its coverage of the 2003 incident and at the way in which Streisand's actions had fueled an internet-led movement

In the twentieth century, reading began to be organised by a series of institutions, which created their own reading communities with their own sets of expectations about books and their relationships to them. It can consequently be argued that the idea that popular culture and, by extension, popular fiction, is manipulated and, in turn, manipulates its consumers, has to do with those early twentieth-century attempts to 'direct' readers through a number of institutions. Whereas the lending library and railway bookstall had, initially, helped change and shape the very *format* of fiction, new institutions sprang up that capitalized on this new format and helped change the *content* of fiction, too. The year 1926 saw the foundation of the American Book-of-the-Month Club that was, in Britain, swiftly followed by the formation of the Book Society in 1927 and the Book Guild in 1930. These clubs, like the lending libraries before them, carefully *selected* individual titles for their readers, and, through the sheer volume of their members, began to have a decisive influence on what was published and what wasn't.

Recent studies have shown how firms' increased tendency to copy best practice from competitors have led to declining margins as products and services become increasingly homogeneous and companies are left to compete on price. Indeed, a similar trend may be occurring in all fields of knowledge. A recent study published in the scientific journal Science showed that a tendency to read and cite only the latest research rather than scan more widely for interesting connections may be behind a decline in breakthrough thinking. So how do you encourage 'next practice' innovation that doesn't get bogged down in the detail of what is happening today and just reproduces what has gone before, but without straying away from the fundamentals?

It is no coincidence that many of the most innovative (a) new car designs have been conceptualized as they were sketched. (b) The Land Rover's iconic shape was born in 1947. Rover's technical director, Maurice Wilks, was holidaying in Anglesey, where he was using an army surplus Willys Jeep as a utility vehicle. Impressed by (c) its abilities, Wilks wondered if (d) a civilian version would boost Rover's stagnant post-war sales. With a stick in the sand, he outlined (e) his concept behind the car. Similarly, while the story that the Mini took shape on the back of a napkin isn't quite correct (Alec Issigonis only used high-quality paper), its revolutionary design was worked out in pencil sketches.

One powerful aspect of thinking strategically and innovatively by drawing in this way is that it can be detached from 'the database' of the past while still being grounded. An experienced draftsman or engineer with a clean sheet can draw unhindered by the weight of what is currently in fashion, while her knowledge of the

fundamentals keeps her from going completely off-beam. So often in modern organizations, the ease which current information is at one's fingertips lengthens the research process and often ends up promoting views that are heavily influenced by current 'best practice' trends, stifling real involvement in particular problems and, hence, real innovation.

Any firm conclusions about whether perfectionism is good or bad are complicated by the fact that perfectionism is a complex personality construct with multiple dimensions. When most people describe perfectionists, they describe people with exceptionally high personal standards. However, in the early 1990s, two different research teams showed that perfectionism has other aspects. Randy Frost and associates showed that the high-standards element of perfectionism is also accompanied by dimensions that tap evaluative concerns such as an excessive concern over mistakes and doubts about action. This work was based on a conceptualization of perfectionism that linked it with self-criticism as part of the construct; that is, Frost and his colleagues described perfectionism as 'high standards of performance which are accompanied by tendencies for overly critical evaluations of one's behaviour.'

All new products and services are introduced to society by corporate entities. This is the essence of the market system: corporate entities try to establish a market position empowered by their product or service offerings. If the offering to the market is what the market needs and wants, directly or indirectly, the corporate entity is rewarded by profitable returns on its activities. It is clear that what the corporate entity offers to the market must be evaluated constantly. This is what I call the innovation mind-set. What the firm innovates both in terms of products and services is going to provide market power, which ensures its existence and its profitability. But in a market system this innovation mind-set must be connected to the consumer mind-set. Firms cannot develop products and services willy-nilly and hope that they will be successful. What is in the subconscious mind of consumers, and further what they have not even thought of but would enhance their lives, are parts of the consumer value mind-set that need to be explored.

When the famous musician Paganini played with an orchestra he made sure that the sounds of his violin would be heard above the orchestra by tuning it a quarter of a tone higher than the other instruments. This sharpening of pitch was not enough for his playing to sound out of tune but it did allow his notes to penetrate above the background harmony of the orchestra.

(B)

Black and white patterning of (a) this species makes effective camouflage, and the receiver would be unlikely to detect a signal that depended on the use of such patterns unless it involved movements that made (b) their patterns more visible. It is not surprising therefore that many species of the forest are brightly colored on those parts of (c) their bodies that are used to send visual signals.

*camouflage 위장하다; 위장

(C)

If you wanted to send a visual signal in such a “noisy” visual environment, it would be pointless to display stripes or patches of black and white. (d) Zebras are actually camouflaged by (e) their black and white stripes when they stand still in dappled light beside or under bushes.

*dappled (햇빛과 그림자 등으로) 아롱진

(D)

This technique is exploited by some animals that need to signal over loud background noise. There is an insect in the rainforests of Southeast Asia that we call “the chainsaw insect” because its penetrating cry is heard above the cacophony of other insects as a sharp, higher frequency. Being seen as well as heard is a special problem in forests because only certain visual signals can be seen easily in the dappled and varying light of dense forest and against the background of complex patterns formed by vines, trunks, and leaves.

‘Christmas card’에 관한 다음 글의 내용과 일치하지 않는 것은?

The English artist John C. Horsley is generally credited with designing the first printed Christmas card around 1843. Further, William Egley may have claim to the honor instead, should an obscure date on his card read “1842” rather than the other possibility of “1849.” Horsley’s creation was commissioned by Sir Henry Cole, an English gentleman who, when etiquette dictated that he send seasonal notes to his numerous friends, elected instead to send cards. On the colored, 3-by-5-inch Horsley card, a prominent center panel displayed a large, happy family consuming spirits. Beneath, a caption read, “A Merry Christmas and a Happy New Year to You,” and two side panels depicted biblical scenes, titled “Clothing the Naked” and “Feeding the Hungry.” Despite the religious panels, some of the more pious citizens strongly objected to the center panel, claiming that the card encouraged drunkenness. The card was issued as a limited edition of a thousand copies, which sold for a shilling each. After Horsley, various card manufacturers added Christmas cards to their inventory as a sideline, Marcus Ward and Company achieving the forefront with their publication of seasonal greeting cards in 1867.

Recent studies have shown how firms' increased tendency to copy best practice from competitors ① have led to declining margins as products and services become increasingly homogeneous and companies are left to compete on price. Indeed, a similar trend may be occurring in all fields of knowledge. A recent study published in the scientific journal *Science* showed that a tendency to read and cite only the latest research rather than scan more widely for interesting connections may be behind a decline in breakthrough thinking. So how do you encourage 'next practice' innovation that doesn't get bogged down in the detail of what is happening today and just ② reproduces what has gone before, but without straying away from the fundamentals?

It is no coincidence ③ that many of the most innovative new car designs have been conceptualized as they were sketched. The Land Rover's iconic shape was born in 1947. Rover's technical director, Maurice Wilks, was holidaying in Anglesey, where he was using an army surplus Willys Jeep as a utility vehicle. ④ Impressed by its abilities, Wilks wondered if a civilian version would boost Rover's stagnant post-war sales. With a stick in the sand, he outlined his concept behind the car. Similarly, while the story that the Mini took shape on the back of a napkin isn't quite correct (Alec Issigonis only used high-quality paper), its revolutionary design was worked out in pencil sketches.

One powerful aspect of thinking strategically and innovatively by drawing in (A) this way is that it can be detached from 'the database' of the past while still being grounded. An experienced draftsman or engineer with a clean sheet can draw unhindered by the weight of what is currently in fashion, while her knowledge of the fundamentals keeps her from going completely off-beam. So often in modern organizations, the ease ⑤ which current information is at one's fingertips lengthens the research process and

often ends up promoting views that are heavily influenced by current 'best practice' trends, stifling real involvement in particular problems and, hence, real innovation.

Any firm conclusions about whether perfectionism is good or bad are (A) straightforward / complicated by the fact that perfectionism is a complex personality construct with multiple _____. When most people describe perfectionists, they describe people with exceptionally (B) low / high personal standards. However, in the early 1990s, two different research teams showed that perfectionism has other aspects. Randy Frost and associates showed that the high-standards element of perfectionism is also accompanied by _____ that tap evaluative concerns such as an excessive concern over mistakes and doubts about action. This work was based on a conceptualization of perfectionism that linked it with self-criticism as part of the construct; that is, Frost and his colleagues described perfectionism as 'high standards of performance which are accompanied by tendencies for overly (C) critical / favorable evaluations of one's behaviour.'

Current environmental policies and regulations in the United States, ① most of them were developed before climate change was recognized as an influence on forest resources, may not be flexible enough to accommodate rapidly changing climate and disturbance regimes. For example, the capacity (budget and personnel) of agencies to suppress wildfires is already ② stretching. Since 2000, the U.S. Forest Service has typically spent \$1-2 billion per year on fire suppression, and nearly 50% of the total agency budget ③ are currently allocated to fire management. If the annual area burned doubles during the twenty-first century, a conservative projection in most modeling studies, then ④ balancing fire suppression versus other management functions will be a critical policy issue in the absence of a large increase in agency budget. Although fuel treatments reduce fire severity and build landscape resilience to wildfire, it will be difficult to offset increasing fire suppression costs without greatly ⑤ increasing budgets for proactive, strategically placed treatments.

All new products and services are introduced to society by corporate entities. This is the essence of the market system: corporate entities try to establish a market position empowered by their product or service offerings. If the offering to the market is what the market needs and wants, directly or indirectly, the corporate entity is (A) damaged / rewarded by profitable returns on its activities. It is clear that what the corporate entity offers to the market must be evaluated constantly. This is what I call the innovation mind-set. What the firm innovates both in terms of products and services is going to provide market power, which (B) ensures / threatens its existence and its profitability. But in a market system this innovation mind-set must be connected to the consumer mind-set. Firms cannot develop products and services willy-nilly and hope that they will be successful. When the famous musician Paganini played with an orchestra he made sure that the sounds of his violin would be heard above the orchestra by tuning it a quarter of a tone higher than (a) the other instruments. This sharpening of pitch was not enough for his playing to sound out of tune but it did allow his notes to penetrate above the background harmony of the orchestra. This technique is exploited by some animals that need to signal over loud background noise. There is an insect in the rainforests of Southeast Asia that we call “the chainsaw insect” because its penetrating cry is heard above (b) the cacophony of other insects as a sharp, higher frequency.

Being seen as well as heard is a special problem in forests because only certain visual signals can be seen easily in the dappled and varying light of dense forest and against the background of complex patterns formed by vines, trunks, and leaves. If you wanted to send a visual signal in such (c) a “noisy” visual environment, it would be pointless to display stripes or patches of black and white. Zebras are actually camouflaged by their black and white stripes when they stand still in (d) dappled light beside or under bushes. Black and white patterning makes effective camouflage, and the receiver would be unlikely to detect a signal that depended on the use of such patterns unless it involved movements that made the patterns more visible. It is not surprising therefore that many species of the forest are brightly colored on those parts of their bodies that are used to send visual signals.

① ‘국민에 의한 국민의 정치’로 이해되는 민주주의는 플라톤에 따르면 정치 체계를 조직하는 가장 좋은 방식이 아니다. ② 왜 아닌가? ③ ‘국가’에서 그는 정확하게 민주주의의 두 가지 뚜렷이 구별되는 특징인 자유와 평등을 비판했다. ④ 자유는 그에게 귀중한 가치가 있었지만, 그는 ‘지나친’ 자유의 위험을 인식하고 있었는데, 그것은 사람들이 자신이 좋아하는 것을 하도록 허용하고, 그것은 그러면 무정부 상태를 초래할 수 있었기 때문이었다. ⑤ 그는 또한 평등은 모든 사람이 통치하는 능력을 지니고 있을 것이라는 착각에 이끌려 모든 사람에게 그렇게 할 권한을 갖도록 허용할 것이기 때문에, 평등의 가치에 대해서도 비판적이었다. ⑥ 더욱이, 그것[평등]은 공익을 돌보지 않고 개인적인 이득에 의해 동기 부여가 되는, 권력을 추구하는 개인을 위한 공간을 조성할 것이다. ⑦ 민주주의는 매우 부패하기 쉬우며, 선동 정치가와 잠재적 독재자에게 문을 열어 줄 것이다. ⑧ 불안정한 정치 체계로서, 무정부 상태와 독재 정치에 취약할 것이기 때문에, 민주주의는 올바른 능력과 도덕을 갖추고, 역량 있는 리더십이 뛰어난 고결한 지도자를 갖지 못할 것이다.

Because industrial robots are usually programmed to repeat precise manipulations, such as welding or paint spraying, their working environment is often carefully designed so that intricate sensory feedback is unnecessary — the robot performs its repetitive tasks in an accurate, efficient, but essentially unintelligent way, without having to take much notice of the world around it. ① Although they make use of sensors to help control and fine-tune their movements, and to avoid major collisions, the behavior of such robots cannot be said to be in any way intelligent. ② If the car on the production line is misaligned or is not the expected shape, the robot cannot react to the new set of circumstances — it can only repeat its pre-programmed movements. ③ While these limitations are manageable in the highly controlled environment of a production line, they become problematic if a robot is to be used in less-structured and less-predictable circumstances. ④ Sensory feedback from the visual systems provides information to the nervous system that is used to establish an internal schema of the motion of the body. ⑤ More complex cases involving untidy or dynamic or noisy environments, or delicate manipulations of objects, usually require more sophisticated sensory feedback and perceptual processing — for instance the use of a vision system to help guide a robot to the desired location.

Only recently in their evolutionary history have humans had the luxury of eating breakfast, lunch, and dinner without having to forage or hunt. Animals living in the wild, including humans, evolved in environments where food was sparse and meals were obtained only intermittently. This is perhaps best illustrated by predators such as wolves and lions, who commonly kill a prey animal only once every week or so. When the predators are in a food-deprived or fasted state, they must be able to determine where they are most likely to find prey and then expend the physical effort required to catch and kill their prey. Individuals whose brains and bodies functioned optimally when in a fasted state were those that survived and passed their genes on to the next generation. Evolution has “sculpted” our cells and organ systems such that they respond to intermittent fasting in ways that enable them to function optimally.

At some point, you, as a leader of creative people, have probably heard the phrase “Let’s let the ‘creatives’ handle that.” It’s as if there ① were some mythical box where complexity goes in one end and amazingness comes out the other. Democracy, understood as “government of the people by the people,” is, according to Plato, not the best way of organizing the political system. Why not? In *Republic*, he criticized precisely the two distinctive features of democracy: freedom and equality. Although freedom was of precious value to him, he was aware of the danger of *excessive* freedom because it allowed people to do what they liked, which could then lead to anarchy. He was also critical about the value of equality, as it would permit everyone to have the right to rule guided by the illusion that everybody would have the capacity to do so. Moreover, it would create space for power-seeking individuals who are motivated by personal gain rather than taking care of the public good. Democracy would be highly corruptible and would open the gate to demagogues and potential dictators. As an unstable political system, democracy, vulnerable as it would be to anarchy and tyranny, would lack virtuous leaders with the proper skills and morals who excel in competent leadership.

Efforts to prevent or at least undo harm to streams began in the late 1800s, but only grew legislative teeth in the late 1960s and early 1970s. The Clean Water Act, in particular, was spectacularly successful in many ways. As one example, it is now possible to swim in most rivers and streams in the United States without having to take a heavy course of antibiotics afterward. The question is how to get us the rest of the way: how do we prevent further harms to rivers and streams, and even improve their ecological, chemical, and physical character and function? Can a market for streams do what command-and-control legislation has (thus far at least) failed to do?

The answer to the latter question is no, or at least not yet. The idea of allowing much-needed development to harm ecosystems as long as we restore comparable ecosystems elsewhere (A) turn / turns out to be quite hard to operationalize. It is very difficult to ensure equivalence between ecosystems that are harmed and those that are restored. Further, we are not yet able to reliably restore most (perhaps all) ecosystem types; natural systems are highly complex, and we are far from understanding the full scope of that complexity, much less (B) been / being able to reproduce it. Finally, in addition to being complex, ecosystems are messy, dynamic, and highly interconnected; standardizing them into simple, tradeable commodities in order to create robust markets is certainly doable, but it raises unsettling questions about (C) how / what, if anything, such simplified versions of ecosystems actually achieve. We thus argue that ecosystem service markets have not delivered on the conservation goals of their advocates and should be radically reconfigured.

An accelerating ① growth of the importance of the service sector is typical of the development of the contemporary economy. The number of service-oriented business entities is continuously increasing. They face the necessity to constantly improve their ② competitiveness in order to win and sustain a desired position on the market. To achieve this, they seek the best methods to communicate with customers, create and influence the demand, and shape a ③ customer-friendly environment. The speed with which self-help books fly off the shelves would seem to suggest that they really do improve our lives. But I have a wise friend who points out that whenever there are multiple solutions to one problem, we can be pretty sure that none of them works. She developed this theory when her dog kept getting sprayed by skunks: each person she consulted offered a different remedy for getting rid of the odor, none of which worked. Similarly, the very fact that _____ might be a sign that none of them is effective. After all, if one of them really did unlock the secret to everlasting happiness, it would corner the market and crowd out all the others. But instead, there is what is known in the self-help industry as the eighteen-month rule, which is that the person most likely to buy a self-help book is someone who bought one eighteen months earlier.

- ① most self-help authors are popular public figures
- ② there are so many self-help books on the market
- ③ a breakthrough program leads you to feel great again
- ④ you can see a few books that promise to improve your life
- ⑤ a huge amount of money is invested into the self-help industry

Because industrial robots are usually programmed to repeat precise manipulations, such as welding or paint spraying, their working environment is often carefully designed so that intricate sensory feedback is unnecessary — the robot performs its repetitive tasks in an accurate, efficient, but essentially unintelligent way, without having to take much notice of the world around it.

- (A) Although they make use of sensors to help control and fine-tune their movements, and to avoid major collisions, the behavior of such robots cannot be said to be in any way intelligent. If the car on the production line is misaligned or is not the expected shape, the robot cannot react to the new set of circumstances — it can only repeat its pre-programmed movements.
- (B) More complex cases involving untidy or dynamic or noisy environments, or delicate manipulations of objects, usually require more sophisticated sensory feedback and perceptual processing — for instance the use of a vision system to help guide a robot to the desired location.
- (C) While these limitations are manageable in the highly controlled environment of a production line, they become problematic if a robot is to be used in less-structured and less-predictable circumstances.

Only recently in their evolutionary history have humans had the luxury of eating breakfast, lunch, and dinner without having to forage or hunt. Animals living in the wild, including humans, evolved in environments where food was sparse and meals were obtained only intermittently. This is perhaps best illustrated by predators such as wolves and lions, who commonly kill a prey animal only once every week or so. When the predators are in a food-deprived or fasted state, they must be able to determine where they are most likely to find prey and then expend the physical effort required to catch and kill their prey. Individuals whose brains and bodies functioned optimally when in a fasted state were those that survived and passed their genes on to the next generation. Evolution has “sculpted” our cells and organ systems such that they respond to intermittent fasting in ways that enable them to function optimally.

Democracy, understood as “government of the people by the people,” is, according to Plato, not the best way of organizing the political system. Why not? In *Republic*, he criticized precisely the two distinctive features of democracy: freedom and equality. ① Although freedom was of precious value to him, he was aware of the danger of *excessive* freedom because it allowed people to do what they liked, which could then lead to anarchy. ② He was also critical about the value of equality, as it would permit everyone to have the right to rule guided by the illusion that everybody would have the capacity to do so. ③ Moreover, it would create space for power-seeking individuals who are motivated by personal gain rather than taking care of the public good. ④ Power-seeking individuals prefer to remain in control in any interpersonal situation and to gain control even in their intimate relationships. ⑤ Democracy would be highly corruptible and would open the gate to demagogues and potential dictators. As an unstable political system, democracy, vulnerable as it would be to anarchy and tyranny, would lack virtuous leaders with the proper skills and morals who excel in competent leadership.

Efforts to prevent or at least undo harm to streams began in the late 1800s, but only grew legislative teeth in the late 1960s and early 1970s. The Clean Water Act, in particular, was spectacularly successful in many ways. As one example, it is now possible to swim in most rivers and streams in the United States without having to take a heavy course of antibiotics afterward. The question is how to get us the rest of the way: how do we prevent further harms to rivers and streams, and even improve their ecological, chemical, and physical character and function? Can a market for streams do _____ (A) _____ command-and-control legislation has (thus far at least) failed to do?

The answer to the latter question is no, or at least not yet. The idea of allowing much-needed development to harm ecosystems as long as we restore comparable ecosystems elsewhere turns out to be quite hard to operationalize. It is very difficult to ensure equivalence between ecosystems that are harmed and those _____ (B) _____ are restored. Further, we are not yet able to reliably restore most (perhaps all) ecosystem types; natural systems are highly complex, and we are far from understanding the full scope of that complexity, much less being able to reproduce it. Finally, in addition to being complex, ecosystems are messy, dynamic, and highly interconnected; standardizing them into simple, tradeable commodities in order to create robust markets is certainly doable, but it raises unsettling questions about what, if anything, such simplified versions of ecosystems actually achieve. We thus argue that ecosystem service markets have not delivered on the conservation goals of their advocates and should be radically reconfigured.

① 식물과 꼭 마찬가지로, 조류도 광합성을 하면서 이산화 탄소를 흡수하여 그것을 자신들의 몸체 분자 속에 가둔다. ② 박테리아처럼, 많은 조류는 매우 연약해서 죽고 나면 곧 분해되므로, 그것들은 이산화 탄소를 공기에서 오래 떨어져 있게 하지 않는다. ③ 하지만 코콜리토포리드(혹은 간단히 코콜리스)라고 불리는 미세 조류는 탄산 칼슘으로 껍질을 만든다. ④ 이 껍질은 매우 밀도가 높아서 코콜리스가 죽자마자, 그 몸체가 해양 바닥으로 가라앉는다. ⑤ 그곳의 차가운 온도는 그 껍질이 수천 년 심지어는 수백만 년 동안 분해되지 않을 정도로 부패를 느리게 한다. ⑥ 결과적으로, 이 미세 조류가 자라서 그런 다음 죽을 때 이산화 탄소가 매우 오랜 기간에 걸쳐 대기권에서 제거된다. ⑦ 지구 온난화를 방지하기 위해 실행할 수 있는 수단 중 하나는 코콜리스가 이미 살고 있는 지역의 바다를 비옥하게 함으로써 이 조류들이 더 빨리 더 풍부하게 자라게 하는 것이다. ⑧ 가설은, 꼭 충분한 양의 적절한 종류의 영양소를 더해 줌으로써, 우리가 석유와 석탄을 태움으로써 일으키는 손상의 많은 부분을 상쇄할 다량의 이산화 탄소 제거를 시작할 만큼 충분히 빨리 코콜리스가 자랄 것이라는 것이다. ⑨ 지금까지 실험적 시도는 고무적이었다.

① 대학교 4학년 때, 내가 들었던 수업 중 하나는 Collin 교수의 수업이었다.

② 조교는 일찍 도착해서 수십 개의 책상을 끌어서 교실 안에 큰 원 모양으로 빙 둘러고, 우리들 각자에게 앞자리를 주었다. ③ 나는 눈에 잘 띄다고 느꼈던 것을 기억하는데, 내가 보통 강의실 중간쯤에 있는 자리를 선호하기 때문이다.

④ Collin 교수는 (강의) 원고도 없이 강의를 했고, 자신이 아침 식사로 먹은 것을 나열하는 것처럼 쉽게 연구를 인용했다.

⑤ 나는 매료된 채로 보고 들었지만 결코 손을 들지는 않았는데, 그 사실은 학기가 흘러갈수록 점점 더 무겁게 내 어깨를 짓 눌렀다.

⑥ 학기의 마지막 몇 주에, Collin 교수는 한 수업이 끝날 때 "우리 앞에서 말하는 데 어려움이 있으면, 내 사무실로 와서 알려 주세요."라고 공지했다. ⑦ 나는 깜짝 놀랐다. ⑧ 나는 과거에 교수로부터 이런 식의 말을 접해 본 적이 없었다.

⑨ 그녀는 더 이상의 설명을 하지 않았다. ⑩ 나는 내가 그것에 대해 걱정하지 말라는 말을 들을지 아니면 머지않아 내가 자신있게 말해야 한다는 말을 들을지 확신할 수 없었다. ⑪ 내가 아는 것이라고는 그녀가 나에게 뜻을 두고 한 말이라는 점이었다. ⑫ 그래서 나는 갔다.

⑬ 나는 Collin 교수의 문 앞에 도착했다. ⑭ 그녀는 나에게 들어오라고 몸짓을 했다. ⑮ 내가 그곳에 온 이유를 작은 목소리로 말하자, 그녀는 안경을 벗고 나를 쳐다보았다. ⑯ "알겠어요."라고 잠시 후에 그녀가 말했다. ⑰ "나에게 알려 줘서 고마워요." ⑱ 나는 그녀가 수업은 어떤지와 같은 것들도 또한 나에게 물어봤을 거라고 확신하는데, 기억이 나지는 않는다. ⑲ 내가 확실히 기억하는 것은, 내가 큰 소리로 말할 용기를 내지 못해서 그녀가 나에게 실망했거나 화가 났다고 나의 불안 필터를 통해 내가 생각했다는 것이다. ㉑ 지금은 내가 그 정도로 어리석지는 않다.

㉒ 내가 Collin 교수의 논문을 연구하고, 그녀의 연구의 뿌리를 발견하고, 그녀를 직접 인터뷰한 후에야 비로소 나는 그녀가 왜 나를 (그리고 당시에는 나뿐이라고 느껴졌지만, 다른 사람들도) 오라고 불러서 나의 어려움을 털어놓게 했는지를 알게 되었다. ㉓ 간단히 말해서, 그녀는 이해했던 것이다. ㉔ 그녀가 안경을 벗고 나를 보았을 때, 내가 이제야 깨달기로는 그것은 비난의 눈길도 아니었다. ㉕ 그것은 알아줌이었다. ㉖ 그것은 이해였다.

Commentators today lament the fact that we no longer share popular cultural references, as we did when there were only three television networks. In the 1960s, the argument goes, everyone could discuss around the water cooler what happened that week on *Doctor Kildare*. In the 1959-1960 season, for example, 40.3 percent of all televisions in use on Saturday night at 10:00 p.m. were turned to *Gunsmoke* on CBS. ❶ _____ (그에 비해), in 2016-2017 the hit *Big Bang Theory* had a viewership of 11.5 percent. Just like plants, algae absorb carbon dioxide as they photosynthesize and lock it into the molecules of their bodies. Like bacteria, many algae are so delicate that they decompose quickly after they die, so they do not keep carbon dioxide out of air for long. However, microscopic algae, called coccolithophorids (or just coccoliths), make a shell of calcium carbonate. This shell is so dense that as soon as the coccoliths die, their bodies sink to the bottom of the oceans. The cold temperatures there slow decay to such a degree that the shells do not break down for thousands, even millions of years. Consequently, as these microscopic algae grow and then die, carbon dioxide is removed from the atmosphere for very long times. One of the possibilities for combating global warming is to make these algae grow faster and more abundantly by fertilizing the oceans in areas where coccoliths already live. The hypothesis is that by adding just enough of the right kinds of nutrients, coccoliths will grow rapidly enough to start removing large amounts of carbon dioxide that will offset much of the damage we do by burning petroleum and coal. So far, experimental trials have been encouraging.

Throw a bunch of *Pseudomonas fluorescens* bacteria in a beaker, and they will rapidly reproduce until they become starved for oxygen. At this point, the survival advantage shifts to a mutant type known as the “wrinkly spreader,” which can create a film that binds them together into a floating colony with access to oxygen from above and nutrients from below. Cooperation allows the group to ① thrive. However, within this cooperative colony there may be some defectors; they produce none of the sustaining film, but instead ② free-ride on that produced by others. With the energy they save by not producing the film, they are able to have more ③ offspring than the cooperative *Pseudomonas*. Competitive individuals (i.e., defectors) within the group outcompete cooperative ones. However, if there are too many defectors, the colony can no longer stay afloat and plunges to the depths of the beaker, losing its relative fitness. Colonies with ④ fewer defectors will continue to thrive and leave more descendants than others. What we see is two distinct types of evolutionary pressure, at the individual and group level. The basic rule is that “Selfishness beats altruism within single groups. Altruistic groups ⑤ follow selfish groups.”

The difference of effect between books which are not literature and those which are is that while the former amuse, entertain, and glance over the surface of the mind, the latter touch the deepest springs of being. Literature books touch us aesthetically, it is true. The emotion aroused is impersonal, and thus removed from the keen thrill which is born of actual experiences; but it depends upon the same passions, the same characteristics, the same humanity, that underlie the joys and sorrows of real life. It is because we are capable of passion and of disappointment that we are moved by the love and anguish of Romeo and Juliet, of Francesca and Paolo. Our emotion is not identical with that with which the heart throbs in personal love and grief; yet art which is genuine awakes emotion thoroughly genuine. Books of sensationalism and sentimentality may excite curiosity, or wonder, or amusement, or sham feelings; but they must have at least some spark of sacred fire before they can arouse in the intelligent reader this inner throb of real feeling.

(A)

In my senior year in college, one of the classes that I took was Professor Collin's. The teaching assistant arrived early and dragged dozens of desks into a huge circle around the room, giving each of us a front-row seat. (a) I remember feeling conspicuous, usually preferring a spot in the middle of a lecture hall. Professor Collin lectured without notes, citing studies as easily as if listing what she had for breakfast. I watched and listened, fascinated, but never raised my hand, a fact that weighed increasingly heavily on my shoulders as the semester wore on.

*conspicuous 눈에 잘 띄는

(B)

It wasn't until researching her paper, discovering Professor Collin's research roots and interviewing her directly that I learned why she invited me (and others — though at the time it felt like (b) me alone) to disclose my difficulty. Simply put, she understood. When she took off her glasses and looked at me, I now realize, it wasn't a look of accusation. It was recognition. It was understanding.

(C)

In the last few weeks of the semester, Professor Collin announced at the end of one class, "If you have trouble speaking in front of a group, come to my office and let me know." I was astonished. I had never encountered this from a professor before. She gave no further explanation. (c) I wasn't sure whether I would be told not to worry about it or that I had better speak up soon. All I knew was that she meant me. So I went.

(D)

I arrived at Professor Collin's door. She motioned for me to come in. After I told her in a tiny voice my reason for being there, she took off her glasses and looked at me. "Okay," she said, after a moment. "Thanks for letting (d) me know." I'm sure she also asked me about how the class was going and stuff, but I don't remember. What I do remember is that through my anxious filter I thought she was disappointed in (e) me or annoyed that I couldn't muster the courage to speak up. Now I know better.

By the 1970s, an entire generation had become immersed in immediate and ubiquitous forms of visual and audio communication. By the end of the decade, Alvin and Heidi Toffler had published *Future Shock* and *The Third Wave*, as well as other books and articles predicting our transition from an industrial-based society to an information-based one. The Tofflers speculated on the dangers that might occur when changes happened too fast, and the possible disruption they would bring. They were the first to use the phrase “information overload.” The Tofflers saw knowledge as the essential commodity of a rapidly changing society that was fast decentralizing into niche networks, where information was becoming more valuable than labor or capital. They predicted that the speed of change would overwhelm and fragment us. In the past, a truth or an untruth could endure for centuries or millennia without challenge. Within many communities in our complex media culture, hierarchies remain. But there is no single hierarchy; there are no principles acknowledged across all the various cultural communities. The communities that create and enjoy rock music or comics no longer regard their work as inferior to the much smaller communities that follow classical music or “serious” fiction. This becomes clear when we consider what has happened to the names that were used to designate the activities of elite art and culture, which began to float freely through our culture, sometimes reclaimed by traditional arts and sometimes appropriated by popular entertainment of all kinds. The traditional, honorific meaning of the term “elite” became embarrassing. Few today claim to be part of elite culture, not even those authors of serious fiction, classical musicians, composers, and painters who had seemed to constitute a class apart in the past. Instead, the term is used to designate the best in almost any field, particularly sports: elite tennis players, elite quarterbacks, elite bowlers. And the term “artist” can be used for almost any kind of creative performer or maker: from painters and sculptors to those who inscribe tattoos (body art).

밑줄 친 memory does not work like a recording device가 다음 글에서 의미하는 바로 가장 적절한 것은?

Over a century of psychological research has shown that memory is constructive and reconstructive. In contrast to lay notions, scientists know from extensive research that memory does not work like a recording device. All memories, including special event memories, are mediated by similar cognitive processes. A special event may be better remembered by witnesses in that the gist of the information, as well as some core details of the event, might be recalled relatively well. However, special memories are malleable, subject to distortion, and affected by the damaging

effects of forgetting, just like everyday memories are. Psychologists have been able to identify a number of socio-cognitive factors that can negatively affect memory and undermine its reliability. In the context of these factors, there are individual differences that make some witnesses more susceptible to false memories.

It was a very hot Sunday morning. The church was so crowded that morning that Mary and Betsy could hardly see over the heads of the people in front of them. During the service, they became impatient and bored and started to wiggle. Betsy slid way down on her spine and rested that way for a while. Mary watched (a) her, and then she tried sitting that way too. When Mother frowned and shook her head, the girls sat up straight. Betsy tap-tap-tapped on the back of the seat in front of her until the woman sitting there turned around and looked at (b) her.

*wiggle 꼼지락거리다

(B)

The girls were glad and relieved when the service was finally over. They started to jump up, but Mother put a firm hand on each girl's arm. Everybody else was leaving the church, but Mother didn't move. "Wait a few minutes, girls," she said quietly. Mary and Betsy looked at each other in wonder. Most of the people had left, but some still stood in the back of the church talking to the minister. Then Mother did a most unusual thing. She slid down in the church chair until her head was below the back of the seat. The girls stared. Mother looked so funny! Then Mother wiggled about on her spine and stuck her feet way under the bench in front of her. Her pretty blue hat was pushed crooked.

*crooked 비뚤어진

(C)

Then Betsy stopped. Mary opened her small pocketbook to take out her handkerchief. Then she took all the rest of the things out of her purse and lined them up on the seat beside her. When Mother noticed and frowned again, Mary hurried to put everything back in her pocketbook, but she dropped two pennies and a pink comb. By the time she picked them up her face was red with embarrassment — several people had turned to look disapprovingly at her. Next Betsy slumped down in her seat again and put her feet up on the hymnbook rack. (c) She blew noisily at the unruly hair that hung down over her nose. Oh, it was a hot and tiresome morning!

*hymnbook : 찬송가집

(D)

"Mother, don't!" Mary whispered. She looked around to see if anyone was noticing her mother's odd actions. Then, Mother opened her purse and started to take things out of it and line them up on the seat beside her. Now both the little girls' faces were red with shame. "Please fix your hat, Mother," Betsy begged. "All

the people are looking at us." Mother looked straight at her two daughters. "People looked at us quite often during the service," (d) she stated simply. "Was it any worse for them to look at you girls then than it is for them to look at me now?" The girls looked at each other in dawning understanding. "Did we look like that?" Mary asked. Mother nodded. "(e) I see what you mean," Betsy stammered.

This shell is so dense that as soon as the coccoliths die, their bodies sink to the bottom of the oceans.

Just like plants, algae absorb carbon dioxide as they photosynthesize and lock it into the molecules of their bodies. Like bacteria, many algae are so delicate that they decompose quickly after they die, so they do not keep carbon dioxide out of air for long. (①) However, microscopic algae, called coccolithophorids (or just coccoliths), make a shell of calcium carbonate. (②) The cold temperatures there slow decay to such a degree that the shells do not break down for thousands, even millions of years. (③) Consequently, as these microscopic algae grow and then die, carbon dioxide is removed from the atmosphere for very long times. (④) One of the possibilities for combating global warming is to make these algae grow faster and more abundantly by fertilizing the oceans in areas where coccoliths already live. (⑤) The hypothesis is that by adding just enough of the right kinds of nutrients, coccoliths will grow rapidly enough to start removing large amounts of carbon dioxide that will offset much of the damage we do by burning petroleum and coal. So far, experimental trials have been encouraging.

Throw a bunch of *Pseudomonas fluorescens* bacteria in a beaker, and they will rapidly reproduce until they become starved for oxygen. At this point, the survival advantage shifts to a mutant type known as the “wrinkly spreader,” which can create a film that binds them together into a floating colony with access to oxygen from above and nutrients from below. Cooperation allows the group to thrive. However, within this cooperative colony there may be some defectors; they produce none of the sustaining film, but instead free-ride on that produced by others. With the energy they save by not producing the film, they are able to have more offspring than the cooperative *Pseudomonas*. Competitive individuals (i.e., defectors) within the group _____ cooperative ones. However, if there are too many defectors, the colony can no longer stay afloat and plunges to the depths of the beaker, losing its relative fitness. Colonies with fewer defectors will continue to thrive and leave more descendants than others. What we see is two distinct types of evolutionary pressure, at the individual and group level. The basic rule is that “Selfishness beats altruism within single groups. Altruistic groups beat selfish groups.”

- (A) In this way, it is possible to associate playful elements with a perhaps more serious design universe — and it is possible that doing so captures a different mood for the recipient than what would otherwise be expected.
- (B) Products can be coded in such a way as to make the decoding process comparatively difficult for the recipient — for example, by attaching a contradictory linguistic message to the object or concept.
- (C) A clothing collection or series of interior designs might be given a title that is not immediately obvious to recipients, because it appears ambiguous, or perhaps because it consists of a compound word or term of one's own invention. It might also be that an unconventional onomatopoeic word, such as *kapow* or *shhh*, has been used in the marketing material or in the emblem of the collection in an effort to anchor the sound in the recipient's consciousness.

In my senior year in college, one of the classes that I took was Professor Collin's. The teaching assistant arrived early and dragged dozens of desks into a huge circle around the room, giving each of us a front-row seat. I remember feeling conspicuous, usually preferring a spot in the middle of a lecture hall. Professor Collin lectured without notes, citing studies as easily as if listing what she had for breakfast. I watched and listened, fascinated, but never raised my hand, a fact that weighed increasingly heavily on my shoulders as the semester wore on.

In the last few weeks of the semester, Professor Collin announced at the end of one class, "(A) If you had trouble speaking in front of a group, come to my office and let me know." I was astonished. I had never encountered this from a professor before. She gave no further explanation. (B) I wasn't sure that I would be told not to worry about it or that I had better speak up soon. All I knew was that she meant me. So I went.

I arrived at Professor Collin's door. She motioned for me to come in. After I told her in a tiny voice my reason for being there, she took off her glasses and looked at me. "Okay," she said, after a moment. "Thanks for letting me know." I'm sure she also asked me about how the class was going and stuff, but I don't remember. What I do remember is that through my anxious filter I thought she was disappointed in me or annoyed that I couldn't muster the courage to speak up. Now I know better.

(C) It was until researching her paper, discovering Professor Collin's research roots and interviewing her directly that I learned why she invited me (and others — though at the time it felt like me alone) to disclose my difficulty. Simply put, she understood. When she took off her glasses and looked at me, I now realize, it wasn't a look of _____. It was recognition. It was understanding.

(A) Commentators today lament the fact that we no longer share popular cultural references, as we did when there were only three television networks. In the 1960s, the argument goes, everyone could discuss around the water cooler what happened that week on *Doctor Kildare*. (B) In the 1959-1960 season, for example, 40.3 percent of all televisions in use on Saturday night at 10:00 p.m. turning to *Gunsmoke* on CBS. By comparison, in 2016-2017 the hit *Big Bang Theory* had a viewership of 11.5 percent. Cable television, the VCR, and the DVD player all had a role in fragmenting viewing audiences for film and television, (C) turning that might once have been a single community into many. More recently Internet streaming has completed the _____. With the exception of some of the leading pop singers and a few actors (George Clooney or Angelina Jolie), there is no performer, television show, or movie that “everyone” has seen or can even name.

*lament 한탄하다

Over a century of psychological research has shown that memory is constructive and reconstructive. In contrast to lay notions, scientists know from extensive research that memory does not work like a recording device. All memories, including special event memories, are mediated by similar cognitive processes. A special event may be better remembered by witnesses in that the gist of the information, as well as some core details of the event, might be recalled relatively well. However, special memories are malleable, subject to distortion, and affected by the damaging effects of forgetting, just like everyday memories are. Psychologists have been able to identify a number of socio-cognitive factors that can negatively affect memory and undermine its reliability. In the context of these factors, 일부 목격자들을 거짓 기억에 더 영향받기 쉽게 만드는 개인적인 차이들이 있다.

It was a very hot Sunday morning. The church was so crowded that morning that Mary and Betsy could hardly see over the heads of the people in front of them. During the service, they became impatient and bored and started to wiggle. Betsy slid way down on her spine and rested that way for a while. Mary watched her, and then she tried ① to sit that way too. When Mother frowned and shook her head, the girls sat up straight. Betsy tap-tap-tapped on the back of the seat in front of her until the woman sitting there turned around and looked at her.

Then Betsy stopped. Mary opened her small pocketbook to take out her handkerchief. Then she took all the rest of the things out of her purse and lined them up on the seat beside her. When Mother noticed and frowned again, Mary hurried to put everything back in her pocketbook, but she dropped two pennies and a pink comb. By the time she picked them up her face was (A) red with embarrassment — several people had turned to look disapprovingly at her. Next Betsy slumped down in her seat again and put her feet up on the hymnbook rack. She ② blew noisily at the unruly hair that ③ hanged down over her nose. Oh, it was a hot and tiresome morning!

The girls were glad and relieved when the service was finally over. They started to jump up, but Mother put a firm hand on each girl's arm. Everybody else was leaving the church, but Mother didn't move. "Wait a few minutes, girls," she said quietly. Mary and Betsy looked at each other in wonder. Most of the people ④ had left, but some still stood in the back of the church talking to the minister. Then Mother did a most unusual thing. She ⑤ slid down in the church chair until her head was below the back of the seat. The girls stared. Mother looked so funny! Then Mother wiggled about on her spine and stuck her feet way under the bench in front of her. Her pretty blue hat was pushed crooked.

"Mother, don't!" Mary whispered. She looked

around to see if anyone was noticing her mother's odd actions. Then, Mother opened her purse and started to take things out of it and line them up on the seat beside her. Now both the little girls' faces were (B) red with shame. "Please fix your hat, Mother," Betsy begged. "All the people are looking at us." Mother looked straight at her two daughters. "People looked at us quite often during the service," she stated simply. "Was it any worse for them to look at you girls then than it is for them to look at me now?" The girls looked at each other in dawning understanding. "Did we look like that?" Mary asked. Mother nodded. "I see what you mean," Betsy stammered.
